# Preface

- [Contacting IBM Unica technical support](#)

## Contacting IBM Unica technical support

If you encounter a problem that you cannot resolve by consulting the documentation, your company's designated support contact can log a call with IBM Unica technical support. Use the information in this section to ensure that your problem is resolved efficiently and successfully.

If you are not a designated support contact at your company, contact your IBM Unica administrator for information.

### Information you should gather

Before you contact IBM Unica technical support, you should gather the following information:

- A brief description of the nature of your issue.
- Detailed error messages you see when the issue occurs.
- Detailed steps to reproduce the issue.
- Related log files, session files, configuration files, and data files.
- Information about your product and system environment, which you can obtain as described in "System Information" below.

### System information

When you call IBM Unica technical support, you might be asked to provide information about your environment.

If your problem does not prevent you from logging in, much of this information is available on the About page, which provides information about your installed IBM Unica applications.

You can access the About page by selecting **Help > About**. If the About page is not accessible, you can obtain the version number of any IBM Unica application by viewing the `version.txt` file located under each application's installation directory.

## Contact information for IBM Unica technical support

For ways to contact IBM Unica technical support, see the IBM Unica Product Technical Support website: (<http://www.unica.com/about/product-technical-support.htm>).

# 1 Preparing to Install

- [About the installation process](#)
- [Interact basic installation checklist](#)
- [IBM Unica components and where to install them](#)
- [Basic installation of Interact](#)
- [Prerequisites](#)
- [If you are upgrading or configuring multiple partitions](#)

## About the installation process

Installing IBM Unica products is a multi-step process that involves working with a number of software and hardware elements that are not provided by IBM Unica . While the IBM Unica documentation provides some guidance regarding specific configurations and procedures required to install IBM Unica products, for details on working with these systems that are not provided by IBM Unica you should consult those products' documentation.

Before you begin to install the IBM Unica Marketing software, you should have engaged in a planning process that takes into consideration both your business objectives and the hardware and software environment required to support them.

## Interact basic installation checklist

This section provides a summarized, high-level overview of the steps required to perform a basic installation of Interact. Each of the steps listed here is explained in more detail elsewhere in this documentation, as indicated.

### Prepare data sources

1. [Step: Create databases or schemas](#)

Work with a database administrator to create the databases or schemas for the Interact runtime and design time system tables.

2. [Step: Create the ODBC or native connections on the Campaign machine](#)

If necessary, create the ODBC or native connections to the database that holds the design environment test run tables.

3. [Step: Configure the web application servers for your JDBC drivers](#)

Add the database drivers to the classpath of the web application servers where the design time and runtime components are installed.

4. [Step: Create JDBC connections in the web application server](#)

Create JDBC connections to the Interact, Campaign, and Marketing Platform system tables, using the required and recommended JNDI names.

**Install IBM Unica Interact**

1. [Step: Obtain the IBM Unica installers](#)

Download or locate the media containing the IBM Unica , Interact, and Interact report package installers.

2. [Step: Obtain required information](#)

Gather the required database and web application server information.

3. [Step: Run the IBM Unica installer](#)

With the Marketing Platform installed, install the Interact components.

**Configure IBM Unica Interact before deployment**

1. [Step: Create and populate the Interact system tables](#)

Use the provided SQL scripts to create and populate the Interact design time and runtime system tables.

2. [Step: Register Interact manually, if necessary](#)

If the installer was unable to register IBM Unica Interact, use Marketing Platform utilities to register manually.

**Deploy IBM Unica Interact**

1. [Step: Deploy IBM Unica Interact](#)

Follow the deployment guidelines to deploy the Interact runtime component (the design time component is deployed when Campaign is deployed).

**Configure IBM Unica Interact after deployment**

1. [Step: Create the Interact system users](#)

Set up system users to access the runtime and design environments.

2. [Steps: Configure IBM Unica Interact configuration properties](#)

Set the required database properties to configure the design and runtime environments on the Settings > Configuration page.

3. [Step: Verify your IBM Unica Interact installation](#)

Log in to Campaign to verify the design environment, and access the runtime URL provided in this guide to verify the runtime environment.

# IBM Unica components and where to install them

The following diagram provides a brief overview of where to install IBM Unica applications. This is the basic installation that will function. You may require a more complex, distributed installation to meet your security and performance requirements.

## Basic installation of Interact

Interact is a member of the Campaign family of applications and has two components you must install, the design environment and the runtime environment.

Before you can install the Interact design environment, you must install and configure Campaign and an associated instance of Marketing Platform.

Before you can install a Interact runtime environment, you must install a separate instance of Marketing Platform. A runtime environment must have an instance of Marketing Platform and at least one instance of the Interact runtime server. You can configure multiple instances of the Interact runtime server to work in the same runtime environment.

The instructions in this guide are designed to enable you to successfully perform a basic installation of Interact. Basic installation is a necessary step, but it is not the end of the installation process. Interact typically requires additional configuration steps to prepare for use in achieving your business objectives.

IBM defines a basic installation as follows.

- All components of the product are installed.
- A system user is configured for the design environment, with administrator-level access to the Campaign system tables.
- A system user is configured for the runtime environment.

You can find information about advanced configurations as shown in the following table.

Topic	Guide
Customizing Unica reporting schemas and sample reports	<i>The IBM Unica Marketing Platform Administrator's Guide and the IBM Unica Interact Administrator's Guide</i>
Configuring use of non-ASCII data or non-US locales	<i>IBM Unica Campaign Administrator's Guide</i>
Configuring use of multiple languages and locales	<i>IBM Unica Campaign Administrator's Guide</i>
Integrating with LDAP and web access control systems	<i>IBM Unica Marketing Platform Administrator's Guide</i>
Configuring SSL	<i>IBM Unica Marketing Platform Administrator's Guide</i>

## Prerequisites

The following are prerequisites for installing IBM Unica Marketing products.

## System requirements

For detailed system requirements, see the *Recommended Software Environments and Minimum System Requirements* guide for the IBM Unica Marketing products you plan to install.

## JVM requirement

Unica recommends a dedicated JVM for For Interact runtime for performance reasons. Some IBM Unica Marketing applications within a suite must be deployed on a dedicated Java™ Virtual Machine (JVM). Some IBM Unica Marketing products require customized JVM settings. If you encounter JVM-related errors, you may need to create a WebLogic or WebSphere domain dedicated to IBM Unica Marketing products.

## Network domain requirement

IBM products that are installed as a Suite must be installed on the same network domain, to comply with browser restrictions designed to limit cross-site scripting security risks.

## IBM Unica Marketing Platform requirement

Before you install any IBM Unica Marketing products, the Marketing Platform must be fully installed and deployed, so that the products you install can register their configuration properties and security roles, and you can set values for configuration properties on the Marketing Platform Configuration page.

In general, for each group of products that you plan to have work together, you need to install the Marketing Platform only once. However, for Interact, the best practice is for each production Interact server group have its own installation of Marketing Platform.

## IBM Unica Campaign requirement

You must install Campaign before you install any of the following Campaign-family products that depend on it: Interact, Optimize, Distributed Marketing, and eMessage.

## Knowledge requirement

To install IBM Unica Marketing products, you must possess or work with people who possess a thorough knowledge of the environment in which the products will be installed, including the operating systems, databases, and web application servers.

## Client machines

Client machines should meet the following configuration requirements.

- Campaign uses an ActiveX control for flowcharts and administration functions. This flowchart automatically downloads when needed. The recommended security settings for the Internet Explorer browser is medium-low for local intranet. Specifically, the client browser must have the following options enabled.
  - **Download signed ActiveX controls**
  - **Run ActiveX controls and plugins**
  - **Script ActiveX controls marked safe for scripting**

- The browser should not cache pages. In Internet Explorer, select **Tools > Internet Options > General > Browsing History > Settings** and choose the option that causes the browser to check for a newer version of the page on each visit.
- If pop-up blocker (ad blocker) software is installed on the client machine, Campaign might not function properly. We recommend disabling pop-up blocker software while running Campaign.

## Access permissions

Verify that your network permissions allow you to perform the procedures in this guide, and that you have logins with appropriate permissions, including the following.

- The administrative password for your web application server.
- Administration access for all necessary databases.
- Write permission for all files that you must edit.
- Write permission for all directories where you must save a file, such as the installation directory and backup directory if you are upgrading.
- Appropriate read/write/execute permissions to run the installer.
- The operating system account that you use to run the web application server and IBM Unica Marketing components must have read and write access to the relevant directory and subdirectories.
- On UNIX, the user account that installs Campaign and the Marketing Platform must be a member of the same group as Campaign users. This user account must have a valid home directory, and have write permissions for that directory.
- On UNIX, all of the installer files for IBM Unica products must have full execute permissions (for example, `rxwxr-xr-x`).

## If you are upgrading or configuring multiple partitions

If you are upgrading, see the sections on preparing to upgrade.

If you plan to create multiple partitions, see the section on configuring multiple partitions.

# 2 Preparing Data Sources for Interact

- About preparing the IBM Unica Interact data sources
- Step: Create databases or schemas
- Step: Create the ODBC or native connections on the Campaign machine
- Step: Configure the web application servers for your JDBC drivers
- Step: Create JDBC connections in the web application server
- IBM Unica Interact database information checklist

## About preparing the IBM Unica Interact data sources

You must set up the required data sources and JDBC connections for Interact. You will need the details about the system table databases later in the installation process, so you should print and fill in the [Unica Interact database information checklist](#) as you perform the steps in this section.

### Step: Create databases or schemas

1. Work with a database administrator to create the required databases or schemas for Interact.

Be sure to see the remainder of this section before you start to create the schemas. It provides information on the databases or schemas you must create.

2. For each of the required databases or schemas have the database administrator create an account that you will specify for a system user later in the installation process.

This account must have at least CREATE, SELECT, INSERT, UPDATE, DELETE, and DROP rights.

3. Obtain the information about your databases or schemas and database accounts and then print and add the information to the [Unica Interact database information Checklist](#). You will use this information later in the installation process.

## Required databases or schemas for Interact

Use this section to determine how many databases or schemas you must create. Interact design environment requires additional tables that are not listed here because they are added to the database or schema that holds the Campaign system tables.

Interact runtime environment can require several databases. The following list provides a brief summary.

- Create a database or schema to hold the Interact Runtime tables. Every server group should have separate database or schema.
- Create a database, schema, or view to hold the user Profile tables. The user profile tables could be in the same database as your Campaign Customer (user) tables. You may want a separate set of user profile tables for each interactive channel.
- Create a database, schema, or view to hold the Test run tables. The Test run tables could be in the same database as your Campaign Customer (user) tables.
- If you are using built-in learning, create a database or schema to hold the Learning tables.
- If you are using cross-session response tracking, create a database or schema to hold a copy of the Campaign Contact History tables. Alternatively, instead of creating a copy you could use the actual Campaign Contact History tables.

## Step: Create the ODBC or native connections on the Campaign machine

The machine on which the Campaign server is installed must be able to communicate with the database that holds the Interact design environment test run tables. These tables may be the same as your customer (user) tables. If so, the connection will already have been created when Campaign was installed.

If the Interact design environment test run tables are not the same as your customer (user) tables, use the following guidelines to create the ODBC or native connection to the database that holds them.

- For databases on UNIX: You create a new native data source in an `ODBC.ini` file. The procedure for creating a native data source differs depending on the data source type and the version of UNIX. See the data source and operating system documentation for specific ODBC driver installation and configuration instructions.
- For databases on Windows: You create a new ODBC data source in the Control Panel's **Administrative Tools > Data Sources (ODBC)** section.

Record the connection names in the [Unica Interact database information checklist](#)

## Step: Configure the web application servers for your JDBC drivers

Use the following procedure to obtain the correct JDBC drivers for your IBM Unica Marketing installation, and to configure your web application server to use it.

! Perform this procedure for every web application server where you plan to deploy your IBM Unica Marketing products.

1. Obtain the latest vendor-provided Type 4 JDBC drivers supported by IBM Unica Marketing. See the reference table or tables in this section for details.
  - If the drivers do not exist on the machine where the product is installed, obtain them and copy them to the machine or machines where you plan to deploy IBM Unica Marketing web applications. You may copy them to any location on the machine where you plan to deploy the IBM Unica Marketing product. To avoid potential path issues, unpack the drivers in a path that does not include spaces.
  - If you obtain the drivers from a machine where the data source client is installed, verify that the version is the latest supported by IBM Unica Marketing.

The following table lists the driver file name or names for database types supported for IBM Unica Marketing system tables.

Database type	File(s)
Oracle 9g and 10g	ojdbc14.jar
Oracle 11	ojdbc5.jar For WebLogic 10g R3, Weblogic 11gR1, and WebSphere 7.0 with JDK 1.6 - use ojdbc6.jar
DB2	db2jcc.jar db2jcc_license_cu.jar - not present in V9.5 or V9.7
SQL Server	You must use version 1.2 or above of the SQL Server driver sqljdbc.jar WebLogic 10g R3, WebLogic 11gR1, and WebSphere 7.0 with JDK 1.6 - use sqljdbc4.jar

2. Include the full path to the drivers in the classpath of the web application servers where you plan to deploy IBM Unica Marketing products, as follows.
  - For all supported versions of WebLogic, set the classpath in the `setDomainEnv` script in the `WebLogic_domain_directory/bin` directory where environment variables are configured. Your driver entry must be the first entry in the CLASSPATH list of values, before any existing values, to ensure that the web application server uses the correct driver. For example:

## UNIX

```
CLASSPATH="/home/oracle/product/10.2.0/jdbc/lib/ojdbc14.jar:${PRE_CLASSPATH}
${CLASSPATHSEP}${WEBLOGIC_CLASSPATH}
${CLASSPATHSEP}${POST_CLASSPATH}${CLASSPATHSEP}${WLP_POST_CLASSPATH}"
export CLASSPATH
```

## Windows

```
set CLASSPATH=c:\oracle\jdbc\lib\ojdbc14.jar;%PRE_CLASSPATH%;
%WEBLOGIC_CLASSPATH%;%POST_CLASSPATH%;%WLP_POST_CLASSPATH%
```

- For all supported versions of WebSphere, set the classpath in the Administration console while you are setting up the JDBC providers for the IBM Unica Marketing products.
3. Restart the web application server so your changes take effect.

During startup, monitor the console log to confirm that the classpath contains the path to the database driver.

## Step: Create JDBC connections in the web application server

You must create JDBC connections in each of the web application servers on which Campaign and Interact will be deployed as listed in the following table.

The list also provides the recommended JNDI names. Using these names simplifies configuration, as they match the default values of configuration properties that refer to these connections.

Deployed web application	JDBC connections are required to these databases
Campaign	<p>In the web application server where Campaign is deployed, create JDBC connections to the databases that hold the following tables.</p> <ul style="list-style-type: none"> <li>• Interact runtime tables JNDI name: <code>InteractRTDS</code></li> <li>• Interact test run tables (which may be the same as the Customer (User) tables) JNDI name: <code>testRunDataSource</code></li> </ul>

Deployed web application	JDBC connections are required to these databases
<p>Interact runtime (This is typically deployed in a different JVM from Campaign)</p>	<p>In the web application server where Interact runtime is deployed, create JDBC connections to the databases that hold the following tables. Note that all JNDI names are recommended, unless otherwise indicated.</p> <ul style="list-style-type: none"> <li>• Interact runtime tables JNDI name: <code>InteractRTDS</code></li> <li>• Interact profile tables JNDI name: <code>prodUserDataSource</code></li> <li>• Interact test run tables (required for test run server group only) JNDI name: <code>testRunDataSource</code></li> <li>• Interact learning tables (if you are using built-in learning) JNDI name: <code>InteractLearningDS</code></li> <li>• Campaign contact and response history tables (if you are using cross-session response tracking) Jndi name: <code>contactAndResponseHistoryDataSource</code></li> <li>• Marketing Platform system tables JNDI name: <code>UnicaPlatformDS</code></li> </ul> <hr/> <p> This is the required JNDI name for connections to the Platform system table database.</p> <hr/> <p>You must set up this JDBC connection only if you are installing the Interact runtime in a web application server where Marketing Platform is not currently deployed. If Marketing Platform is deployed in the same web application server, this JDBC connection is already defined.</p>

Record the JNDI names that you used in the [Unica Interact database information checklist](#).

## Information for JDBC connections

When you create a JDBC connection, you can use this section to help you determine some of the the values you must enter. If you are not using the default port setting for your database, change it to the correct value.

Note that this information does not exactly reflect all of the information required by the web application servers. Where this section does not provide explicit instructions, you may accept the default values. Consult the application server documentation if you need more comprehensive help.

### WebLogic

Use these values if your application server is WebLogic.

#### SQLServer

- Driver: Microsoft's MS SQL Server Driver (Type 4) Versions: 2005

- Default port: 1433
- Driver class: com.microsoft.sqlserver.jdbc.SQLServerDriver
- Driver URL:  
`jdbc:sqlserver://your_db_host:your_db_port;databaseName=your_db_name`
- Properties: Add `user=your_db_user_name`

### Oracle 10g and 11

- Driver: Other
- Default port: 1521
- Driver class: oracle.jdbc.OracleDriver
- Driver URL: `jdbc:oracle:thin:@your_db_host:your_db_port:your_db_service_name`
- Properties: Add `user=your_db_user_name`

### DB2

- Driver: Other
- Default port: 50000
- Driver class: com.ibm.db2.jcc.DB2Driver
- Driver URL: `jdbc:db2://your_db_host:your_db_port/your_db_name`
- Properties: Add `user=your_db_user_name`

## WebSphere

Use these values if your application server is WebSphere.

### SQLServer

- Driver: N/A
- Default port: 1433
- Driver class: com.microsoft.sqlserver.jdbc.SQLServerConnectionPoolDataSource
- Driver URL: N/A

In the **Database Type** field, select **Other**.

After you create the JDBC Provider and Data Source, go to the Custom Properties for the Data Source, and add and modify properties as follows.

- `serverName=your_SQL_server_name`
- `portNumber =SQL_Server_Port_Number`
- `databaseName=your_database_name`
- `enable2Phase = false`

### Oracle 10g and 11

- Driver: Oracle JDBC Driver

- Default port: 1521
- Driver class: oracle.jdbc.OracleDriver
- Driver URL: jdbc:oracle:thin:@*your\_db\_host*:*your\_db\_port*:*your\_db\_service\_name*

**DB2**

- Driver: DB2 Universal JDBC Driver Provider
- Default port: 50000
- Driver class: com.ibm.db2.jcc.DB2Driver
- Driver URL: jdbc:db2://*your\_db\_host*:*your\_db\_port*/*your\_db\_name*

## IBM Unica Interact database information checklist

---

- ⚡ All of the Interact data sources must be of the same type. For example, if your Campaign system tables are in Oracle databases, all the other databases must be Oracle.
- 

### Runtime tables

You may have multiple databases containing runtime tables. Enter the information for each runtime environment.

Database schema 1

---

JNDI name 1

---

Database schema 2

---

JNDI name 2

---

Database schema 3

---

JNDI name 3

---

### Contact response history tables

Used only when cross-session tracking is being implemented. These may be the same as your Campaign contact response history tables, or they may be in a different database server or schema.

Database schema

---

JNDI name

---

## Learning tables

These are optional.

Database schema

---

JNDI name

---

## User profile tables

These may be in your customer (user) tables.

Database schema

---

JNDI name

---

## Test run tables

These may be in your customer (user) tables.

Database schema

---

DSN (ODBC or native connection name)

---

JNDI name

---

# 3 Installing IBM Unica Interact

- Step: Obtain the IBM Unica installers
- Copying installation files (DVD only)
- How the IBM Unica Marketing installers work
- Step: Obtain required information
- Step: Run the IBM Unica installer

## Step: Obtain the IBM Unica installers

Obtain the DVD, or download the software from IBM.

- The IBM Unica installer
- The Interact installer

If you plan to use the IBM Unica reporting feature, see the *IBM Unica Marketing Platform Installation Guide* for instructions on how to install it.

This installation guide assumes you have already installed and configured Campaign for the design environment and at least one instance of Marketing Platform for each runtime environment.

### Setting permissions on UNIX-type systems

On UNIX-type systems, ensure that the installation files have full execute permissions (`rxrxr-xr-x`).

### Choosing the right installer file

The IBM Unica Marketing installation files are named according to the version of the product and the operating system with which they are meant to be used, except for UNIX files intended to be run in console mode, which are not operating system-specific. For UNIX, different files are used depending on whether the installation mode is X-windows or console. If different installers exist for 32- and 64-bit operating systems, these numbers are also included in the file name. If no bit number is included, the installer is for both 32-bit and 64-bit operating systems.

Here are some examples of the installers you would choose based on your installation environment.

**If you plan to install on Windows using either GUI or console mode —**

*ProductN.N.N.N\_win.exe* is version N.N.N.N and is intended for installation on the Windows 32-bit or 64-bit operating systems.

**If you plan to install on Solaris using X-windows mode —**

*ProductN.N.N.N\_solaris64.bin* is version N.N.N.N and is intended for installation on the Solaris 64-bit operating system.

**If you plan to install on UNIX using console mode —** *ProductN.N.N.N.sh* is version N.N.N.N and is intended for installation on all UNIX operating systems.

## Copying installation files (DVD only)

If you received your IBM Unica installation files on a DVD, or if you created a DVD from a downloaded ISO image file, you must copy its contents to a writable directory available to the system on which you will be installing the IBM Unica products before running the installers.

You cannot run IBM Unica Marketing installers directly from read-only media, such as the installation DVD, an ISO image mounted read-only, or a write-restricted directory or volume.

---

 For additional information on where to place the installation files, see [How the IBM Unica Marketing installers work](#).

---

## How the IBM Unica Marketing installers work

You should read this section if you are not familiar with the basic functions of the IBM Unica installer.

### Single directory requirement for installer files

When you install IBM Unica enterprise products, you use a combination of installers.

- A master installer, which has `Unica_Installer` in the file name
- Product-specific installers, which all have the product name as part of their file names

To install IBM Unica Marketing products, you must place the master installer and the product installers in the same directory. When you run the master installer, it detects the product installation files in the directory and lets you select the products you want to install.

When multiple versions of a product installer are present in the directory with the master installer, the master installer always displays the latest version of the product on the IBM Unica Products screen in the installation wizard.

## Installing patches

You may be planning to install a patch immediately after you perform a new installation of an IBM Unica product. If so, you should place the patch installer in the directory with the base version and master installer. When you run the installer, you can select both the base version and the patch, and the installer will install both in correct order.

## Choosing product installation directories

You can install to any directory on any network-accessible machine. You can specify an installation directory by entering a path or by browsing and selecting it.

You can specify a path relative to the directory from which you are running the installer by typing a period before the path.

If the directory you specify does not exist, the installer creates it, assuming that the user performing the installation has appropriate permissions.

The default top-level directory for IBM Unica installations is named `Unica`. The product installers then install in subdirectories under the `Unica` directory.

## Installation types

The IBM Unica installer performs the following types of installation.

- **New installation** – When you run the installer and select a directory where an IBM Unica Marketing product has never been installed, the installer automatically performs a new installation.
- **Upgrade installation** – When you run the installer and select a directory where an earlier version of an IBM Unica Marketing product has previously been installed, the installer automatically performs an upgrade installation. See the Upgrading chapters for details.
- **Re-installation** – When you run the installer and select a directory where the same version of an IBM Unica Marketing product has previously been installed, the installer automatically performs a new installation. This overwrites all of the files in your existing installation directory.

If automatic database table creation is available for the product, and you select it, your data in the system tables is not modified, except for navigation menu items. If you have modified the navigation menu, you should use the Marketing Platform `configTool` utility to export those configuration properties, so you can restore them after you re-install. If you have not modified the navigation menu, you do not need to do anything, as the installer will simply re-create the default menu items.

You may see some errors because the installer will not be able to create tables in the database, as they already exist. You can safely ignore these errors.

## Installation modes

The IBM Unica installer can run in the following modes.

- Console (command line) mode

In console mode, you enter numbers to select options. If you do not enter a number, but just press **Enter**, the default option is selected.

Default options are indicated by one of the following:

- [X]

When this symbol appears, and you want to select an option other than the one it is next to, first enter the number shown next to the symbol to de-select that option, followed by a comma and the number you do want to select.

- ->

When this symbol appears, and you want to select an option other than the one it is next to, enter the number you want to select. You do not have to de-select the default option explicitly, as you do for the other type.

- Windows GUI or UNIX X-windows mode
- Unattended mode, which allows no user interaction

Unattended, or silent, mode is used when you must install IBM Unica product multiple times, for example when you set up a clustered environment. See [Installing multiple times using unattended mode](#) for more information.

## Installing multiple times using unattended mode

If you must install IBM Unica Marketing products multiple times, for example when setting up a clustered environment, you may want to run the IBM Unica installer in unattended mode, which requires no user input.

### About the response files

Unattended (also known as silent) mode requires a file or set of files that provides the information that a user would enter in the installer wizard when using GUI or console modes. These are known as response files.

The installer automatically creates these response files when you perform an installation in console mode or Windows GUI or UNIX X-windows modes. Therefore, you would normally run the installer in one of these modes to create the response files before setting up an unattended run.

The response files are named `installer_product.properties`, except for the file for the IBM Unica installer itself, which is named `installer.properties`. The installer creates these files in the directory where the installer is located.

### Backup requirement for response files

You must create a backup version of the response files, because each time you run in unattended mode, the installer overwrites the `.properties` files with an empty version of the files. Therefore, you must replace the empty files with your backed-up version each time you run in unattended mode.

## Effect of unattended mode when you uninstall

When you uninstall a product that was installed using unattended mode, the uninstall is performed in unattended mode (without presenting any dialogs for user interaction).

## Where to install IBM Unica Interact components

The Interact design environment must be installed with Campaign. For best performance, IBM recommends that you install a runtime server on its own machine, where no other IBM Unica Marketing products are installed.

**!** You must fully install and deploy a Marketing Platform for each server group. If you install multiple Interact server groups, you must fully install and deploy the Marketing Platform in each runtime server group.

The following table describes the components you can select when you install Interact.

Component	Description
Interact Runtime Environment	<p>The Interact runtime server. You integrate Interact runtime servers with a touchpoint, such as a web site, to present offers based on real-time data.</p> <p>You can install multiple runtime servers in your environment and organize them into server groups. Each server group must have one instance of the Marketing Platform separate from the Marketing Platform for Campaign and separate from other server groups.</p>
Interact Design Environment	The design environment for Interact. You must install the design environment on the same machine as Campaign. You must install only one design environment.

## Where to install IBM Unica Interact Report Package components

The reports package for Interact contains two installation components, as follows.

- Install the reporting schemas on the Marketing Platform system.
- Install the IBM Cognos package on the IBM Cognos system.

The following table describes the components you can select when you install the reports package for Interact.

Component	Description
IBM Unica Interact reporting schemas (to be installed on the IBM Unica Marketing system)	The Interact reporting schemas make interactive channel-based campaign, offer, and cell data from all three Interact data sources available for reporting.

Component	Description
IBM Cognos package for IBM Unica Interact (to be installed on the IBM Cognos system)	The IBM Cognos package includes a reporting metadata model for the Interact database tables and a set of example reports that you can use to track campaign, offer, and cell performance.

## About multiple Interact runtime servers

All Interact runtime servers in a single server group must use the same schema for runtime tables, profile tables, and learning tables.

IBM recommends that each production Interact server group has its own instance of Marketing Platform, although this is not a firm requirement. It is possible for Interact runtime servers in the same server group to use the same instance of Marketing Platform (recommended), a unique instance of Marketing Platform for each Interact runtime server, or a few instances of Marketing Platform supporting subsets of runtime servers. For example, if your server group contains 15 runtime servers, 5 runtime servers can report to one instance of Marketing Platform, for a total of 3 instances of Marketing Platform.

If you have multiple instances of Marketing Platform, the general Interact configurations must match across all instances of Marketing Platform for a given server group. You must define the same runtime tables, profile tables, and learning tables for all instances of Marketing Platform in each server group. All Interact servers belonging to the same server group must share the same user credentials. If you have separate Marketing Platform instances for each Interact server, you must create the same user and password on each.

If you are installing a test environment and have multiple Interact runtime servers on the same machine:

- Each Interact runtime server instance must be in a separate web application instance.
- If you are configuring JMX monitoring for Interact servers running on the same machine, you must configure each Interact runtime server's JMX monitoring to use a different port and instance name. Edit the `JAVA_OPTIONS` in your web application server startup script and add the following options.
  - `-Dinteract.jmx.monitoring.port=portNumber`
  - `-Dinteract.runtime.instance.name=instanceName`

You must also set the instance name if you are using a database load utility to work with several Interact servers running on the same machine.

## Step: Obtain required information

Gather the information you must enter in the installer, as described in this section.

## IBM Unica Marketing Platform information

The installation wizards for all IBM Unica Marketing products must be able to communicate with the Marketing Platform system table database, to register the product's security information, menu items, and configuration properties.

Each time you run the installer in a new location, you must enter the following database connection information for the Marketing Platform system table database.

- Database type.
- Database host name.
- Database port.
- Database name or schema ID.
- User name and password for the database account.

You obtained this information when you created the Marketing Platform database or schema and filled out the Marketing Platform database information checklist.

Database connection information is also required for the system table databases of IBM Unica Marketing products if you select the automatic database setup option during installation.

## Web component information

For each IBM Unica Marketing web component that you deploy on a web application server, you must obtain the following.

- The name of the machine on which the web application server is installed.
- The port on which the application server listens. If you plan to implement SSL, obtain the SSL port.
- The network domain on which your deployment machine resides. For example, `example.com`.

## Step: Run the IBM Unica installer

Before you run the IBM Unica installer, verify that you have met the following prerequisites.

- You have downloaded the IBM Unica installer and the installers for products you plan to install, and you have put both the IBM Unica and product installers in the same directory.
- You have available the information you gathered as described in [Obtain required information](#).

If you are re-running the installer on a machine where other IBM Unica products are installed, do not reinstall these products.

See the other topics in this section for details about the installer, or if you need help entering information in the wizard.

Run the IBM Unica installer as described here, and follow the instructions in the wizard.

- GUI or X-windows mode

Run the `Unica_Installer` file. On UNIX, use the `.bin` file.

- Console mode

Open a command prompt and from the directory where you downloaded the IBM Unica software, run the `Unica_Installer` executable file as follows.

On Windows, run the `Unica_installer` executable file with `-i console`. For example, `Unica_Installer_N.N.N.N_OS -i console`

On UNIX, run the `Unica_installer.sh` file with no switch.

- Unattended mode

Open a command prompt and from the directory where you downloaded the IBM software, run the `Unica_Installer` executable file with `-i silent`. On UNIX, use the `.bin` file. For example, to specify a response file located in the same directory as the installer:

```
Unica_Installer_N.N.N.N_OS -i silent
```

To specify a response file in a different directory, use `-f filepath/filename`. Use a fully qualified path. For example:

```
Unica_Installer_N.N.N.N_OS -i silent -f filepath/filename
```

For more information about unattended mode, see [Installing multiple times using unattended mode](#).

## Navigating in the installation wizards

When the installer runs in GUI mode, you navigate using the **Next**, **Previous**, **Cancel**, and **Done** buttons.

When the installer runs in console mode, you navigate by entering numbers that correspond to the buttons in GUI mode, as described in the help text on each screen of the wizard. In console mode, an additional redisplay command is available.

In console mode, a number or letter is displayed in square brackets at the end of the prompt line; this is the default command issued if you press **Enter** without typing anything. You can type **back** to go to a previous screen, or `quit` to cancel the installation.

## IBM Site ID

The installer may prompt you to enter your IBM Site ID. Your IBM Site ID can be found on the IBM Welcome letter, Tech Support Welcome letter, Proof of Entitlement letter, or other communications sent when you purchased your software.

IBM may use data provided by the software to better understand how customers use our products and to improve customer support. The data gathered does not include any information that identifies individuals.

If you do not want to have such information collected, after the Marketing Platform is installed, log in to the Marketing Platform as a user with administration privileges, navigate to the **Settings > Configuration** page, and set the **Disable Page Tagging** property under the **Platform** category to **True**.

## To create an EAR file after running the installer

Use this procedure if you want to create an EAR file after you have installed IBM Unica Marketing products. You might want to do this if you decide you want a different combination of products in the EAR file.

The WAR files must be in a single directory. You will run the installer in console mode, from the command line.

1. If this is the first time you are running the installer in console mode, make a backup copy of the installer's `.properties` file for each of your installed products.

These files are located in the same directory where you have placed the IBM Unica product installers. They are named `installer_product.properties`, except for the file for the IBM Unica installer itself, which is named `installer.properties`.

If you plan to run the installer in unattended mode, you should back up the original `.properties` files, because when the installer runs in unattended mode, it clears these files. To create an EAR file, you need the information that the installer writes in the `.properties` files during the initial install.

2. Open a command window and change directories to the directory that contains the installer.
3. Run the installer executable with this option:

```
-DUNICA_GOTO_CREATEEARFILE=TRUE
```

On UNIX-type systems, run the `.bin` file rather than the `.sh` file.

The installer wizard runs.

4. Follow the instructions in the wizard.
5. Before you create additional EAR files, overwrite the `.properties` file or files with the backup(s) you created before you ran in console mode for the first time.

# 4 Configuring IBM Unica Interact Before Deployment

- About pre-deployment configuration of IBM Unica Interact
- Step: Create and populate the Interact system tables
- Step: Create the Interact user profile tables
- Step: Register Interact manually, if necessary

## About pre-deployment configuration of IBM Unica Interact

You must perform the tasks described in this section before you deploy Interact.

Neither the design environment or the runtime environment has pre-deployment configuration tasks.

## Step: Create and populate the Interact system tables

Use your database client to run the Interact SQL scripts against the appropriate database or schema to create and populate the Interact runtime environment; design environment; learning; user profile; and contact and response tracking data sources.

### Design environment tables

Before you can enable the Interact design environment in Campaign, you must add some tables to your Campaign system table database.

The following tables list the SQL scripts you can use to manually create and populate the design environment tables.

The SQL scripts are located in the `Interact/interactDT/ddl` directory under your Interact design environment installation.

If your Campaign system tables are configured for unicode, use the appropriate script located in the `Interact/interactDT/ddl/unicode` directory under your Interact design environment installation. There are no Unicode equivalent scripts for the `aci_populate_systab` scripts used to populate the design environment tables.

### Scripts for creating design time tables

Data source type	Script name
IBM DB2	<code>aci_systab_db2.sql</code>  The user tablespace and system temporary tablespace where the Campaign system tables reside must each have a page size of 16K or greater.
Microsoft SQL Server	<code>aci_systab_sqlsvr.sql</code>
Oracle	<code>aci_systab_ora.sql</code>

### Scripts for populating design-time tables

Data source type	Script name
IBM DB2	<code>aci_populate_systab_db2.sql</code>
Microsoft SQL Server	<code>aci_populate_systab_sqlsvr.sql</code>
Oracle	<code>aci_populate_systab_ora.sql</code>

## Runtime environment tables

The following tables list the SQL scripts you can use to create and populate the Interact runtime tables.

The SQL scripts are located in the `ddl` directory under your Interact installation.

If your Interact runtime tables are configured for Unicode, use the appropriate script located in the `ddl/Unicode` directory to create the runtime tables. There are no Unicode equivalent scripts for the `aci_populate_runtab` scripts used to populate the runtime tables.

You must run these scripts once per server group data source.

## Scripts for creating runtime environment tables

Data source type	Script name
IBM DB2	aci_runtab_db2.sql  The user tablespace and system temporary tablespace where the Interact runtime environment tables reside must each have a page size of 16K or greater.
Microsoft SQL Server	aci_runtab_sqlsvr.sql
Oracle	aci_runtab_ora.sql

## Scripts for populating runtime environment tables

Data source type	Script name
IBM DB2	aci_populate_runtab_db2.sql  You must use the following command when running this script: db2 +c -td@ -vf aci_populate_runtab_db2.sql
Microsoft SQL Server	aci_populate_runtab_sqlsvr.sql
Oracle	aci_populate_runtab_ora.sql

## Tables for optional features

The following tables list the SQL scripts you can use to create and populate tables for Interact features including learning, global offers, score override, and contact and response history tracking.

### Learning

All of these SQL scripts are located in the `ddl` directory under your Interact installation.

- ✦ The built-in learning module requires a separate data source from the Interact runtime environment tables. If you are using the built-in learning module, you must create a data source to hold all of the learning data. This separate data source can communicate with all server groups. This means you can learn from your different touchpoints at the same time.

If your Interact runtime tables are configured for Unicode, use the appropriate script located in the `ddl/Unicode` directory under your Interact installation to create the learning tables.

## Learning table scripts

Data source type	Script name
IBM DB2	aci_lrntab_db2.sql
Microsoft SQL Server	aci_lrntab_sqlsvr.sql
Oracle	aci_lrntab_ora.sql

## Contact and response history

The following tables list the SQL scripts you must run against the contact history tables if you are using cross-session response tracking or the advanced learning feature.

All of the SQL scripts are located in directories specified under your Interact installation.

- ⚡ Using contact and response history features requires a separate data source from the Interact runtime environment tables. If you are using contact and response history, you must create a data source to reference contact and response data. This separate data source can communicate with all server groups.

If your contact history tables are configured for Unicode, use the appropriate script located in the `Unicode` directory under the same location as the standard script to create the learning tables.

## Contact history table scripts

Data source type	Script name
IBM DB2	<code>&lt;Interact_HOME&gt;/ddl/aci_crhtab_db2.sql</code> <code>&lt;Interact_HOME&gt;/interactDT/ddl/acifeatures/aci_lrnfeature_db2.sql</code>
Microsoft SQL Server	<code>&lt;Interact_HOME&gt;/ddl/aci_crhtab_sqlsvr.sql</code> <code>&lt;Interact_HOME&gt;/interactDT/ddl/aci_lrnfeature_sqlsvr.sql</code>
Oracle	<code>&lt;Interact_HOME&gt;/ddl/aci_crhtab_ora.sql</code> <code>&lt;Interact_HOME&gt;/interactDT/ddl/aci_lrnfeature_ora.sql</code>

## Step: Create the Interact user profile tables

Some optional features in Interact, such as global offers, offer suppression, and score override, require specific tables in your user profile databases. Refer to the *IBM Unica Interact Administrator's Guide* for details about the profile database, and the role that the offer suppression, global offers, and score override tables play in offer serving.

Use your database client to run the appropriate SQL scripts against the appropriate database or schema and create these required user tables. If you have more than one audience level defined, you need to create one of each required table for each audience level.

### User profile tables

The following table lists the SQL scripts you must use to create the following optional profile tables:

- Global offers table (UACI\_DefaultOffers)
- Offer suppression table (UACI\_BlackList)
- Score override table (UACI\_ScoreOverride)

The SQL scripts are located in the `ddl` directory under your Interact installation.

You must run these scripts once per audience level. Modify the script for each different audience level (after the first) and rename the profile tables created after running the scripts.

### Scripts for creating user profile tables

Data source type	Script name
IBM DB2	aci_usrtab_db2.sql
Microsoft SQL Server	aci_usrtab_sqlsvr.sql
Oracle	aci_usrtab_ora.sql

### Advanced scoring (optional)

The following tables list the SQL scripts you must run if you are using the advanced scoring feature to override the Interact learning algorithm.

All of the SQL scripts are located in the `ddl/acifeatures` directory under your Interact installation.

If your scoring tables are configured for Unicode, use the appropriate script located in the `ddl/acifeatures/Unicode` directory under your Interact installation to create the learning tables.

Note that these scripts are intended to be run against the User Profile database.

## Scoring table scripts

Data source type	Script name
IBM DB2	aci_scoringfeature_db2.sql
Microsoft SQL Server	aci_scoringfeature_sqlsvr.sql
Oracle	aci_scoringfeature_ora.sql

## Step: Register Interact manually, if necessary

If the Interact installer could not connect with the Marketing Platform system tables during the installation process, an error message appears that notifies you of this failure. The installation process will proceed, but if you see the error message, you must import the Interact information into the Marketing Platform system tables manually after the installer closes. Follow the directions for each product as shown in this section.

The utilities mentioned in these procedures are located in the `tools/bin` directory under your Marketing Platform installation.

### To register IBM Unica Interact design environment manually

If the Interact installer cannot connect to the Marketing Platform database to register the product, run the `configTool` utility, using the following example commands as guidelines. This imports menu items and sets configuration properties. Note that you run the utility as many times as there are files. Because there is one file, you must run the utility one time.

```
configTool -i -p "Affinium|suite|uiNavigation|mainMenu|Campaign" -
f "full_path_to_Interact_DT_installation_directory\interactDT\
conf\interact_navigation.xml"
```

```
configTool -v -i -o -p Affinium|Campaign|about -
f "full_path_to_Interact_DT_installation_directory\interactDT\
conf\interact_subcomponent_version.xml"
```

The Interact design environment configuration properties are included with the configuration properties for Campaign.

For detailed instructions on using the `configTool` utility, see [The configTool utility](#) in the *IBM Unica Marketing Platform Installation Guide*.

You may need to manually enable Interact by setting the Campaign > partitions > partition[n] > server > Internal > interactInstalled configuration property to **yes**.

### To register IBM Unica Interact runtime environment manually

If the Interact installer cannot connect to the Marketing Platform database to register the product, run the `configTool` utility, using the following example commands as guidelines. This imports configuration properties. Note that you run the utility as many times as there are files. Because there is one file, you must run the utility one time.

! You should register only one instance of the Interact runtime environment with the Marketing Platform per server group. All instances of Interact runtime server in a server group use the same set of configuration properties. If you register a second Interact runtime server with the Marketing Platform, you may overwrite previous configuration settings.

```
configTool -r Interact -  
f "full_path_to_Interact_RT_installation_directory\conf\  
interact_configuration.xml"
```

The Interact runtime environment has no graphical user interface, so there is no need to register any navigation files.

For detailed instructions on using the `configTool` utility, see [The configTool utility](#) in the *IBM Unica Marketing Platform Installation Guide*.

# 5 Deploying Interact

- Step: Deploy IBM Unica Interact
- WebSphere guidelines
- WebLogic guidelines

## Step: Deploy IBM Unica Interact

Follow the guidelines in this topic for deploying the Interact design environment and runtime servers.

We assume that you know how to work with your web application server. Consult your web application server documentation for details such as navigation in the Administration console.

### Deploying the design environment

When you ran the IBM Unica installer, you may have included Interact in an EAR file, or you may choose to deploy the Interact WAR file. If you included the Marketing Platform or other products in an EAR file, you must follow all the deployment guidelines detailed in the individual install guides for the products included in the EAR file.

After you have installed Interact, the design environment is deployed automatically when you deploy Campaign. After you deploy the Campaign `.war` file, there are some configuration procedures that will enable the design environment in Campaign. Note that the Campaign `.war` file is located in the Campaign installation directory.

### Deploying the runtime server

You must deploy the Interact runtime server for every instance of the runtime server you install. For example, if your performance requirements require six instances of a runtime server, you must install and deploy Interact runtime six times. You can deploy the runtime server on the same server as the design environment, or on a separate server. `InteractRT.war` is located in the Interact installation directory.

---

 When you deploy the Interact runtime, you must change the context root from `InteractRT` to `interact`.

---

# WebSphere guidelines

## Guidelines

Follow the guidelines in this section when deploying IBM Unica Marketing EAR files on WebSphere.

- If you are deploying IBM Unica Marketing EAR files on WebSphere 6.1, ensure that your version is WebSphere 6.1.0.21 or higher.
- If you are deploying IBM Unica Marketing EAR files on WebSphere 7.0, ensure that your version is WebSphere 7.0.0.7 or higher.
- Ensure that the JDK source level of the JSP compiler is set to Java 1.5, as follows.
  - In the form where you browse to and select the WAR file, select **Show me all installation options and parameters** so the **Select Installation Options** wizard runs.
  - In step 1 of the **Select Installation Options** wizard, select **Precompile JavaServer Pages files**.
  - In step 3 of the **Select Installation Options** wizard, ensure that the **JDK Source Level** is set to 15.

## Steps for deploying on Websphere

1. Deploy the IBM Unica EAR file as an enterprise application.
2. In the server's **Web Container Settings > Session Management** section, enable cookies.
3. In the server's **Applications > Enterprise Applications** section, select the EAR file or WAR files that you deployed, then select **Class loading and update detection** and set the following General Properties:
  - If you are deploying a WAR file:
    - For **Class loader order**, select **Classes loaded with application class loader first**.
    - For **WAR class loader policy**, select **Class loader for each WAR file in application**.
  - If you are deploying an EAR file:
    - For **Class loader order**, select **Class loader for each WAR file in application**.
    - For **WAR class loader policy**, select **Class loader for each WAR file in application**.
4. If your system tables are in DB2, go to the data source's Custom Properties. Set the value for **resultSetHoldability** to 1.

If you do not find a field named **resultSetHoldability**, add this as a custom property with the value set to 1.

5. If you are deploying multiple IBM Unica applications, modify the session cookie name for each deployed application to ensure that it is unique, as follows:
  - In the server's **Applications > Enterprise Applications > [deployed\_application] > Session Management > Enable Cookies > Cookie Name section**, specify the session cookie name.
  - Select the **Override session management** checkbox.

## IBM WebSphere Application Server V7.0 requires fixpack 7.0.0.17 or higher

If you plan to use the IBM WebSphere Application Server V7.0 to deploy any IBM Unica Marketing products, you must apply Fix Pack 17 (also referred to as Version 7.0.0.17) or higher to address a security issue. This applies to all WebSphere Application Server 7.0 packages, including the version that is bundled with some IBM Unica Marketing products.

You can obtain Fix Pack 17 or higher here:

<http://www-01.ibm.com/support/docview.wss?rs=180&uid=swg27013594>.

Note that on that page, you must select the correct Fix Pack before you download.

For additional information about supported WebSphere versions for deploying IBM Unica Marketing products, see the *Recommended Software Environments and Minimum System Requirements* document for each product.

## WebLogic guidelines

Follow the guidelines in this section when deploying IBM Unica Marketing products on WebLogic.

### All versions of WebLogic, all IBM Unica Marketing products

- IBM Unica Marketing products customize the JVM used by WebLogic. You may need to create a WebLogic instance dedicated to IBM Unica Marketing products if you encounter JVM-related errors.
- Verify that the SDK selected for the WebLogic domain you are using is the Sun SDK by looking in the startup script (`startWebLogic.cmd`) for the `JAVA_VENDOR` variable. It should be set to: `JAVA_VENDOR=Sun`. If it is set to `JAVA_VENDOR=BEA`, JRockit has been selected. JRockit is not supported. To change the selected SDK, refer to the WebLogic documentation.
- Deploy the IBM Unica Marketing products as web application modules.

- On UNIX systems, you must start WebLogic from the console to allow correct rendering of graphical charts. The console is usually the machine on which the server is running. In some cases, however, the web application server is set up differently.

If a console is not accessible or does not exist, you can emulate a console using Exceed. You must configure Exceed so that your local Xserver process connects to the UNIX machine in root window or single window mode. If you start the web application server using Exceed, you must keep Exceed running in the background to allow the web application server to continue running. Please contact IBM Unica Technical Support for detailed instructions if you encounter problems with chart rendering.

Connecting to the UNIX machine via telnet or SSH always causes problems rendering charts.

- If you are configuring WebLogic to use the IIS plug-in, review the WebLogic documentation.

# 6 Configuring Interact After Deployment

- About post-deployment configuration of Interact
- Steps: Set Interact configuration properties
- Step: Create the Interact system users
- Step: Verify your Interact installation

## About post-deployment configuration of Interact

You must perform the tasks described in this section after you deploy Interact.

In addition, if you are using the IBM Unica Marketing reporting feature, you must install the reports packs for Interact as described in the *Marketing Platform Installation Guide*.

## Steps: Set Interact configuration properties

This section describes the minimum configuration properties you must set on the Configuration page for a basic installation of Interact.

Interact also has properties on the Configuration page that perform important functions that you can optionally adjust. See the *IBM Unica Interact Administrator's Guide* or the context help for the properties to learn more about what they do and how to set them.

You must set these required properties as described in this section.

### The Interact runtime environment

- Step: Configure Interact runtime environment properties.
- Step: Configure multiple Interact runtime servers

### The Interact design environment

1. Step: Configure the Test Run data source.
2. Step: Add server groups.
3. Step: Configure an interactive flowchart test run.

4. [Step: Configure the contact and response history module.](#)

## Step: Configure Interact runtime environment properties

The following properties must be set for basic Interact runtime operation. There are other properties you can configure later to tune your performance.

You must configure these properties for every server group.

- **Data source for the profile tables for the runtime environment.**
  - `Interact > general > prodUserDataSource > jndiName`
  - `Interact > general > prodUserDataSource > schema`
  - `Interact > general > prodUserDataSource > type`
- **Data source for the runtime environment system tables.**
  - `Interact > general > systemTablesDataSource > jndiName`
  - `Interact > general > systemTablesDataSource > schema`
  - `Interact > general > systemTablesDataSource > type`
- **Data source for the test run tables.**
  - `Interact > general > testRunDataSource > jndiName`
  - `Interact > general > testRunDataSource > schema`
  - `Interact > general > testRunDataSource > type`
- **Data source for built-in learning tables. These properties are required only if you are using built-in learning.**
  - `Interact > general > learningTablesDataSource > jndiName`
  - `Interact > general > learningTablesDataSource > schema`
  - `Interact > general > learningTablesDataSource > type`
- **Data source of the contact and response history tables for cross-session response tracking. These properties are required only if you are using cross-session response tracking.**
  - `Interact > general > contactAndResponseHistoryDataSource > jndiName`
  - `Interact > general > contactAndResponseHistoryDataSource > schema`
  - `Interact > general > contactAndResponseHistoryDataSource > type`
- `Interact > profile > Audience Levels`

These categories must match the audience levels you have defined for Campaign, however you only need to configure the audience levels used in interactive flowcharts.

## Step: Configure multiple Interact runtime servers

If possible, you should configure your server groups to work with a load balancer with persistent (sticky) sessions enabled. If this is not possible, you must create some method of selecting runtime servers from a server group when working with the Interact API.

If you cannot use a load balancer with persistent (sticky) sessions, you can configure the runtime servers in a server group to use a multicast address for sharing cache data. All of these servers must comprise a single server group.

---

 If you are using a distributed cache, you must enable multicast to work between all members of a server group.

---

1. Install additional Interact runtime servers as described in this guide.

When installing multiple runtime servers, you must remove network connectivity for the Interact Run Time machine before running the installer, so that additional Interact installations do not overwrite the Marketing Platform configuration.

After installing all instances of the Interact Run Time server, restart Marketing Platform.

2. To enable a distributed cache, when configuring the configuration properties, also configure the following properties:
  - **Interact > sessionManagement > cacheType** — set to **Distributed**.
  - **Interact > sessionManagement > multicastIPAddress** — define the IP address all the Interact servers for this server group use for listening. This IP address must be unique across your server groups.
  - **Interact > sessionManagement > multicastPort** — define the port all the Interact servers use for listening.

---

 When uninstalling an Interact server from a server group, you must follow special instructions to be sure that you do not accidentally remove all IBM Unica Marketing configuration.

---

### Related Topics

- To uninstall Interact

## Step: Configure the Test Run data source

Interactive flowcharts require a connection to the Interact test run tables by adding the Interact test run tables as a Campaign data source. To add an additional Campaign data source, add a new category to `Campaign > partitions > partitionN > datasources` as described in the *IBM Unica Campaign Installation Guide*.

Use the `OwnerForTableDisplay` property to define a database schema to limit the tables displayed when mapping tables in an interactive channel.

The test run data source used in the Interact design time should specify the JNDI name of the design time test run tables.

If you are configuring your Interact environment for multiple locales, see the *IBM Unica Campaign Administrator's Guide* for information on configuring the encoding properties as required for your database type.

If you are using a SQL Server database and you are setting your locale to Japanese or Korean, you must configure the following properties in your test run data source.

- **Campaign > partitions > partitionN > datasources > testRunDataSource > ODBCUnicode** — `UCS-2`
- **Campaign > partitions > partitionN > datasources > testRunDataSource > stringEncoding** — `WIDEUTF-8`

## Step: Add server groups

You must define the locations of the Interact runtime servers on the Configurations page in the Marketing Platform for the design environment to access them for deployment and performing test runs of Interactive flowcharts.

You must create at least one server group, and the server group must contain at least one Interact runtime server, defined by the instance URL. You may have multiple server groups, for example, one to Interact with your web site, one to Interact with your call center, and one for testing. Each server group can contain multiple instance URLs, each instance URL representing one instance of Interact runtime.

---

**!** Each Interact runtime can be associated with one design time only.

---

If you have multiple Interact design time systems running in your environment, any Interact server configured with a particular design time cannot be configured with any other design time. If two different design times send deployment data to the same Interact runtime, the deployments may become corrupted and undefined behavior will occur.

For every server group in the Interact design time configuration, you must specify the JNDI name for the user profile tables. This is necessary to support runtime features in Interact, such as global offers, offer suppression, score override, and offer by SQL in the Interact List process box.

Create these server groups using the **Campaign > partitions > partition $n$  > Interact > serverGroups > (serverGroup)** configuration property template. The category name is only used for organizational purposes, however, you can use the same name for the category as for the `serverGroupName` property to avoid confusion.

## Step: Select a server group for interactive flowchart test run

Interactive flowcharts require an instance of the Interact runtime to run. You cannot use the Campaign batch flowchart engine to run an interactive flowchart. You must define a server group for Campaign to reference for performing test runs of Interactive flowcharts.

Set the following configuration properties to configure interactive flowchart test run. This server group is also used for validating table mapping for the interactive channel, and checking the syntax of user macros in interactive flowcharts.

- Campaign > partitions > partition $N$  > Interact > flowchart > serverGroup
- Campaign > partitions > partition $N$  > Interact > flowchart > dataSource

## Step: Configure the contact and response history module

The Interact runtime servers store contact and response history in staging tables. To make this data available for reporting and use with Campaign, you must configure the contact and response history module to copy the data from the Interact runtime servers to the Campaign contact and response history tables.

---

 You must configure the Interact runtime data source credentials in the design environment configuration page for the contact and response history module to function.

---

1. Confirm that you have added the Interact runtime databases to the web application server hosting Campaign.
2. Add a runtime data source using the Campaign > partitions > partition $N$  > Interact > contactAndResponseHistTracking > runtimeDataSources > (*runtimeDataSource*) configuration property template.
3. Repeat these steps for each Interact runtime server group from which you want to collect contact and response history data.

## Step: Create the Interact system users

Interact requires you to configure two sets of users, runtime environment users and design environment users.

- **Runtime environment users** are IBM user accounts configured to work with the Interact runtime servers. This user is required to send Interact configuration data from the design environment to the runtime environment and when using JMX monitoring with the JMXMP protocol.
- **Design environment users** are Campaign users. Configure the security for the various members of your design team as described in the *Campaign Administrator's Guide*.

### Runtime environment user

---

! The Interact runtime user account must be an internal user account.

---

The person who sends Interact configuration data from the design environment to the runtime environment must log in as a IBM Unica Marketing user. This internal user account must exist in the instance of the Marketing Platform that the Interact runtime server is dependent on.

---

! All Interact servers belonging to the same server group must share the same user credentials for runtime deployment. If you have separate Marketing Platform instances for each Interact server, you must create an account with the same user login name and password on each.

---

If you enable security for JMX monitoring with the JMXMP protocol, you may need a separate user for JMX monitoring security.

### Design environment users

You configure Interact design environment users in the same way you configure Campaign users, as described in the *Campaign Administrator's Guide*.

You should configure a Interact design environment user to have all the permissions of a Campaign user to edit flowcharts and the permissions listed in the following table.

For any Campaign user who has permission to edit interactive flowcharts, you must store data source credentials for the Interact test run tables in their account.

Category	Permissions
Campaigns	<ul style="list-style-type: none"> <li>• View Campaign Interaction Strategies — Ability to see but not edit interaction strategy tabs in a campaign.</li> <li>• Edit Campaign Interaction Strategies — Ability to make changes to interaction strategy tabs, including treatment rules.</li> <li>• Delete Campaign Interaction Strategies — Ability to remove interaction strategy tabs from campaigns. Deletion of an interaction strategy tab is restricted if the interactive channel to which it has been assigned has been deployed.</li> <li>• Add Campaign Interaction Strategies — Ability to create new interaction strategy tabs in a campaign.</li> <li>• Initiate Campaign Interaction Strategy Deployments — Ability to mark an interaction strategy tab for deployment or undeployment.</li> </ul>
Interactive Channels	<ul style="list-style-type: none"> <li>• Deploy Interactive Channels — Ability to deploy an interactive channel to Interact runtime environments.</li> <li>• Edit Interactive Channels — Ability to make changes to interactive channels.</li> <li>• Delete Interactive Channels — Ability to remove interactive channels. Deletion of interactive channels is restricted if the interactive channel has been deployed.</li> <li>• View Interactive Channels — Ability to see but not edit interactive channels.</li> <li>• Add Interactive Channels — Ability to create new interactive channels.</li> <li>• View Interactive Channel Reports — Ability to see the analysis tab of the interactive channel.</li> <li>• Add Interactive Channel Child Objects — Ability to add interaction points, zones, events, and categories.</li> </ul>
Sessions	<ul style="list-style-type: none"> <li>• View Interactive Flowcharts — Ability to see an interactive flowchart in a session.</li> <li>• Add Interactive Flowcharts — Ability to create new interactive flowcharts in a session.</li> <li>• Edit Interactive Flowcharts — Ability to make changes to interactive flowcharts.</li> <li>• Delete Interactive Flowcharts — Ability to remove interactive flowcharts. Deletion of interactive flowcharts is restricted if the interactive channel to which this interactive flowchart is assigned has been deployed.</li> <li>• Copy Interactive Flowcharts — Ability to copy interactive flowcharts.</li> <li>• Test Run Interactive Flowcharts — Ability to initiate a test run of an interactive flowchart.</li> <li>• Review Interactive Flowcharts — Ability to see an interactive flowchart and open processes to view settings, but unable to make changes.</li> <li>• Deploy Interactive Flowcharts — Ability to mark an interactive flowcharts for deployment or undeployment.</li> </ul>

If you have Interact installed and configured, the following additional options are available for the default Global Policy and new policies. Remember that some Interact users also require some Campaign permissions such as Custom Macros.

## Step: Verify your Interact installation

To verify that the Interact design environment is installed, log into the IBM Unica Marketing and confirm you can access **Campaign > Interactive Channels**.

To verify that a Interact runtime environment is correctly installed, use the following procedure.

1. Access the Interact runtime URL using Internet Explorer.

The URL is:

```
http://host.domain.com:port/interact/jsp/admin.jsp
```

where `host.domain.com` is the machine where Interact is installed and `port` is the port number on which the Interact application server is listening.

2. Click **Interact Initialization Status**.

If the Interact server is running correctly, Interact responds with the following message:

```
System initialized with no errors!
```

If the initialization fails, review this installation procedure and confirm that you have followed all the instructions.

# 7 Configuring Multiple Partitions in Interact

- [About partitions](#)
- [Setting up multiple partitions for Interact](#)

## About partitions

In the Campaign family of products, partitions provide a way to secure the data associated with different groups of users. When you configure Campaign or a related IBM Unica Marketing application to operate with multiple partitions, each partition appears to application users as a separate instance of the application, with no indication that other partitions exist on the same system.

For IBM Unica Marketing applications that operate with Campaign, you can configure the application only within partitions where you have already configured an instance of Campaign. Application users within each partition can access only the Campaign functions, data, and customer tables configured for Campaign in the same partition.

## Setting up multiple partitions for Interact

You can configure Interact to work with multiple partitions, as described in the following sections.

### Runtime environments

Interact runtime does not support multiple partitions. You cannot configure the Interact runtime to work in multiple partitions, nor can one Interact runtime work with multiple partitions from a design time.

### Design time environments

You can create multiple partitions to use with Campaign and the Interact design time environment. You can use partitions to configure Interact and Campaign so that different groups of users have access to different sets of Interact and Campaign data.

If you set up multiple partitions with Campaign, you are setting up multiple partitions for Interact. You must configure each partition to communicate with a separate Interact runtime environment, including separate Marketing Platform and runtime tables, for each design time partition, as shown in the following diagram.

You must manually enable Interact for the partition by setting the `Campaign > partitions > partitionN > server > internal > interactInstalled` configuration property to `yes`.

For each partition, you must perform the Design Time configuration steps listed in [Set Unica Interact configuration properties](#) in the "Configuring Unica Interact After Deployment" chapter.

# 8 Preparing to Upgrade IBM Unica Interact

- Upgrade prerequisites for all IBM Unica Marketing products
- Order of upgrading
- Interact upgrade scenarios

## Upgrade prerequisites for all IBM Unica Marketing products

To upgrade any IBM Unica Marketing product, you must meet all of the prerequisites listed under [Prerequisites](#) in the "Preparing to Install" chapter.

In addition, you must meet the prerequisites listed in this section.

### User account requirement (UNIX only)

On UNIX, the same user account that installed the product must perform the upgrade.

### 32-bit to 64-bit version upgrades

If you are moving from a 32-bit to a 64-bit version of an IBM Unica Marketing product, ensure that the following conditions are met.

- The database drivers for your product data sources are also 64-bit
- All relevant library paths (for example, startup or environment scripts) correctly reference the 64-bit versions of your database drivers

### Knowledge requirements

These instructions assume that the person performing the upgrade has an understanding of the following.

- The basic function of the IBM Unica installer, as described in [How the IBM Unica installers work](#)
- General IBM Unica Marketing product functionality and components, including the structure of the file system
- The installation and configuration process for the source product version and for the new version

- Maintaining configuration properties in your source and target systems
- The installation and configuration process for reports, if you are using these reports

## Order of upgrading

The same considerations described in [Order of installation](#) apply when you upgrade with one exception.

A Interact 8.x runtime can run an Interact 7.x deployment; therefore you should upgrade your runtime environments before your design environment.

Also be aware that you must successfully upgrade Marketing Platform prior to or at the same time as the upgrade of any other IBM Unica Marketing product. You cannot upgrade any IBM Unica Marketing products without also upgrading Marketing Platform to the compatible release.

## Interact upgrade scenarios

Follow these guidelines for upgrading to the new version of Interact.

Source version	Upgrade path
Any 5.x or 6.x version	<p>Perform a new installation of the new version of Interact in a new location.</p> <hr/> <p> There is no upgrade path from Interact 5.x or 6.x to the new version of Interact.</p>
Any 7.x or 8.x version	<ol style="list-style-type: none"> <li>1. Perform an in-place installation of the new version over your old version. Use the Interact installer for both the design environment and the runtime environment.           <hr/> <p> You must upgrade Campaign before upgrading your Interact design environment.</p> </li> <li>2. Run the upgrade tools to upgrade configuration settings, files, and data from your source Interact version.</li> <li>3. Upgrade your reports following the instructions in the chapter "Upgrading Reports" in the <i>Marketing Platform Installation Guide</i>.</li> </ol>

# 9 Upgrading IBM Unica Interact

- [About upgrading Interact](#)
- [Upgrading Interact](#)
- [Upgrading from any Interact 7.x or 8.x version](#)
- [To upgrade from any Interact 7.x or 8.x version](#)

## About upgrading Interact

Before you upgrade from any version of Interact, be sure you have read and understood the following information.

- The introductory chapter [Preparing to Upgrade IBM Unica Interact](#), which contains important information about upgrading all IBM Unica Marketing products.
- All the topics in this section, to understand what you must do to upgrade from your old version of Interact to the new version.

## Upgrading Interact

You can upgrade Interact beginning with version 7.5.x.

Due to the architectural changes between Interact version 7.5.0 and previous versions of Interact, there is no upgrade path from earlier versions of Interact.

The following sections describe how to perform an in-place upgrade of Interact.

## Upgrading from any Interact 7.x or 8.x version

To upgrade from any Interact 7.x or 8.x version, you perform an in-place upgrade installation of the new version of Interact, then run the upgrade tool to upgrade system data.

Before performing the upgrade, read the following sections.

- [About the Unica Interact upgrade tools](#)

- [About the upgrade log](#)
- [About upgrading partitions](#)
- [About starting and stopping servers during upgrading](#)

## About the Interact upgrade tools

Interact provides five upgrade tools, one for upgrading the design environment (`aciUpgradeTool`) and four for upgrading the runtime environment (`aciUpgradeTool_crhtab`, `aciUpgradeTool_lrntab`, `aciUpgradeTool_runtab`, and `aciUpgradeTool_usrtab`). These scripts are delivered with the new version of Interact, and are only available after you have run the IBM Unica Marketing suite installer in clean or upgrade mode for both the runtime environment and the design environment.

You upgrade the Interact design environment configuration properties when you upgrade the Campaign configuration properties.

Tool	Location	Purpose
<code>aciUpgradeTool</code>	<i>Interact_Design_Install_Directory</i> <i>/interactDT/tools/upgrade</i>	Upgrades the Interact design environment tables in the Campaign system tables.
<code>aciUpgradeTool_runtab</code>	<i>Interact_Runtime_Install_Directory</i> <i>/tools/upgrade</i>	Upgrades the Interact runtime environment tables and the Interact runtime environment configuration properties.
<code>aciUpgradeTool_lrntab</code>	<i>Interact_Runtime_Install_Directory</i> <i>/tools/upgrade</i>	Upgrades the Interact learning tables.
<code>aciUpgradeTool_crhtab</code>	<i>Interact_Runtime_Install_Directory</i> <i>/tools/upgrade</i>	Upgrades the contact and response history tables used with cross-session response tracking.
<code>aciUpgradeTool_usrtab</code>	<i>Interact_Runtime_Install_Directory</i> <i>/tools/upgrade</i>	Upgrades the Interact tables required in your profile user tables.

When running any of the upgrade tools, you can abort the upgrade at any prompt by typing `abort`.

## About the upgrade log

When you run the upgrade tool, it writes processing details, warnings, and errors to a log file.

By default, the log is named `aci_upgrade.log` and is located in a `logs` directory in the same directory as the upgrade tool. The log file's location and level of verbosity are specified in the `setenv` script file, and you can modify those settings prior to running the tool if needed by opening the `setenv` script in any text editor.

## About upgrading partitions

If you have multiple partitions in the Interact design environment, run the upgrade tool once for each partition.

---

! Partitions must have the same names in the source and target versions.

---

The Interact runtime environment does not require additional procedures if you have multiple partitions.

## About starting and stopping servers during upgrading

When the JDBC drivers in WebLogic are used for migration, the web application server on which the new version of the Interact runtime server is deployed must always remain running to provide access to the database drivers.

# To upgrade from any Interact 7.x or 8.x version

The following lists provide the tasks you need to perform to upgrade from any Interact 7.x or 8.x version to the new version of Interact.

- Upgrade the Interact runtime environments.
  1. [Export configuration settings](#)  
Perform this step once per server group.
  2. [Back up Interact runtime server](#)  
Perform this step once per server group.
  3. For upgrades from 7.x: Upgrade Affinium Manager to the Marketing Platform.  
Perform this step per instance of Manager for your runtime environments.
  4. [Undeploy Interact](#)  
Perform this step for every runtime server.
  5. [Install Unica Interact runtime in upgrade mode](#)  
Perform this step for every runtime server.

6. [Review SQL upgrade script and modify, if necessary](#)  
Perform this step once for each set of runtime environment databases.
  7. [Set environment variables](#)  
Perform this step once for each set of runtime environment databases.
  8. [Run the upgrade tools](#)  
Perform this step once for each set of runtime environment databases.
  9. [Redeploy Unica Interact in the web application server](#)  
Perform this step for every runtime server.
- Upgrade Interact design environment
    1. [Export configuration settings](#)
    2. For upgrades from 7.x: Upgrade Affinium Manager to the Marketing Platform.
    3. Upgrade your Campaign installation.
    4. [Install Unica Interact design environment in upgrade mode](#)
    5. [Set environment variables](#)
    6. [Run the upgrade tools](#)
  - After you upgrade your Interact design environment and runtime environments, you are ready to upgrade your Interact implementation.
    1. [Upgrade existing interactive channels](#)
    2. [Upgrade existing interactive flowcharts](#)
    3. [Upgrade Interact API](#)

## Back up Interact runtime environment

Back up all files and the system table database used by your old installation of Interact runtime environment. You only need to back up one Interact runtime server per server group.

If your Interact runtime environment installation will require any of the configuration settings from your old Interact version in addition to the new (default) settings in the new version, use the `configTool` utility to export the old Interact configuration parameters. Specify a different file name for the `exported.xml` file and note the location to which you save it.

## Undeploy Interact runtime server

You must perform this step so that the web application server releases the lock on the `InteractRT.war` file, which will be updated by the Interact upgrade installation. This allows the upgrade to cleanly update the `InteractRT.war` file and register the new version of Interact in the IBM Unica Marketing console.

1. Follow the instructions in your web application server to undeploy the Interact `.war` file, and save or activate all changes.
2. Shut down and restart the web application server after undeploying Interact runtime server to ensure that the lock on `.war` file is released.

## Install the new version of Interact

Follow the detailed installation steps in [Installing the products](#) to install the new version of Interact. To ensure that the installer automatically upgrades your existing installation, make sure you perform the following step:

- When upgrading the design environment, when prompted for the install location during installation, select the same location as your old Interact Design Time system's location.
- When upgrading the runtime environment, when prompted for the install location during installation, select the same location as your old Interact Run Time system's location.

## Review SQL upgrade script and modify, if necessary

If your Interact runtime environment includes customizations to the runtime system tables that modified the default Data Definition Language (DDL) included with Interact, you must modify the default SQL upgrade script for your database to match your customizations.

Common customizations include changes to support multiple audience levels or using views of tables. You may want to review the data dictionaries for the new versions of IBM Unica products to confirm column sizes map correctly and that foreign key constraints from additional products do not conflict.

The `aci_runtab_upgrd` and the `aci_usrtab_upgrd` are the SQL upgrade scripts that most likely require revisions.

---

**!** You must complete these changes before running the Interact upgrade tool.

---

1. Locate the upgrade script for your database type. The scripts are installed in the `/ddl/Upgrades` or `/ddl/Upgrades/Unicode` directory under your Interact installation after you run the IBM Unica Marketing installer in upgrade mode.

2. Ensure that your database schema matches the DDL included with Interact. If your database schema does not match the DDL in the upgrade script, edit the script for your database type to match your environment.

## Example modifications to the SQL upgrade script

The following example shows required modifications to the `aci_runtab_upgrd` SQL upgrade script for supporting additional audience levels.

Your existing Interact design environment contains an additional audience level called Household. To support this audience level, your Interact runtime environment database contains tables named `HH_CHStaging` and `HH_RHStaging`.

### Required changes to the upgrade script

Locate the code in the SQL upgrade script that updates response history and treatment sizes for the Customer audience level and replicate it for your Household audience level. Change the table names in these statements to the appropriate names for your Household audience level.

You must also revise the SQL to support the data type change for the `SeqNum` column in the `UACI_RHStaging` table. The value of the `SeqNum` is a sequential number across all response history staging tables. The next value used is tracked by the `NextID` column in the `UACI_IdsByType` table where the `TypeID` is 2. For example, you have three audience levels, customer, household, and account. In the customer response history staging table the highest `SeqNum` is 50. In the the household response history staging table the highest `SeqNum` is 75. In the the account response history staging table the highest `SeqNum` is 100. Therefore, you must alter the SQL to set the `NextID` for `TypeID = 2` in the `UACI_IdsByType` to 101.

The following example SQL statements show the required additions to the `aci_runtab_upgrd_sqlsvr.sql` script for a SQL Server database containing the Household audience level. Text that has been changed to support the Household audience level is in bold:

```
ALTER TABLE UACI_CHStaging ADD RTSelectionMethod int NULL
go

ALTER TABLE UACI_RHStaging ADD RTSelectionMethod int NULL
go

ALTER TABLE HH_CHStaging ADD RTSelectionMethod int NULL go ALTER TABLE
HH_RHStaging ADD RTSelectionMethod int NULL go

insert into UACI_IdsByType (TypeID, NextID) (select 2,
IDENT_CURRENT('UACI_RHStaging') +
IDENT_CURRENT('HH_RHStaging') + IDENT_INCR( 'UACI_RHStaging' ) )
go

select * into UACI_RHStaging_COPY from UACI_RHStaging
go

select * into HH_RHStaging_COPY from HH_RHStaging go

DROP TABLE UACI_RHStaging
go
```

```

CREATE TABLE UACI_RHStaging (
    SeqNum          bigint NOT NULL,
    TreatmentCode   varchar(512) NULL,
    CustomerID      bigint NULL,
    ResponseDate    datetime NULL,
    ResponseType    int NULL,
    ResponseTypeCode varchar(64) NULL,
    Mark           bigint NOT NULL
                                DEFAULT 0,
    UserDefinedFields char(18) NULL,
    RTSelectionMethod int NULL,
    CONSTRAINT iRHStaging_PK
        PRIMARY KEY (SeqNum ASC)
)
go

insert into UACI_RHStaging (SeqNum, TreatmentCode, CustomerID,
ResponseDate, ResponseType, ResponseTypeCode, Mark,
UserDefinedFields, RTSelectionMethod)
    (select SeqNum, TreatmentCode, CustomerID, ResponseDate,
ResponseType, ResponseTypeCode, Mark, UserDefinedFields,
RTSelectionMethod from UACI_RHStaging_COPY)
go

DROP TABLE UACI_RHStaging_COPY
go

DROP TABLE HH_RHStaging go CREATE TABLE HH_RHStaging ( SeqNum bigint NOT
NULL, TreatmentCode varchar (512) NULL, HouseholdID bigint NULL,
ResponseDate datetime NULL, ResponseType int NULL, ResponseTypeCode
varchar (64) NULL, Mark bigint NOT NULL DEFAULT 0, UserDefinedFields
char (18) NULL, RTSelectionMethod int NULL, CONSTRAINT iRHStaging_PK
PRIMARY KEY (SeqNum ASC) ) go insert into HH_RHStaging (SeqNum,
TreatmentCode, HouseHoldID, ResponseDate, ResponseType,
ResponseTypeCode, Mark, UserDefinedFields, RTSelectionMethod) (select
SeqNum, TreatmentCode, HouseHoldID, ResponseDate, ResponseType,
ResponseTypeCode, Mark, UserDefinedFields, RTSelectionMethod from
HH_RHStaging_COPY) go DROP TABLE HH_RHStaging_COPY go

```

For DB2 and Oracle databases, the following statement would be used for inserting values into the UACI\_IdsByType table:

```

INSERT into UACI_IdsByType (TypeID, NextID) (select 2,
COALESCE(max(a.seqnum)+1,1) + COALESCE(max(b.seqnum)+1,1) from
UACI_RHSTAGING a, ACCT_UACI_RHSTAGING b );

```

If you have multiple audiences, you will need to add sections to the aci\_usrtab\_upgrd SQL script for each audience level as shown in the following example. The example shows the modified additions only.

```

ALTER TABLE HH_ScoreOverride ADD
    OverrideTypeID int NULL,
    CellCode       varchar(64) NULL,
    Zone           varchar(64) NULL
go

```

```

ALTER TABLE HH_ScoreOverride  ADD
      Predicate                varchar(4000) NULL,
      FinalScore                float NULL,
      EnableStateID            int NULL
go

CREATE INDEX iScoreOverride_IX1 ON HH_ScoreOverride
(
      HouseholdID                ASC
)
go

```

## Set environment variables

Edit the `setenv` file to set environment variables required by the upgrade tool.

For the Interact design environment, the file is located in the `/interactDT/tools/upgrade` directory under your Interact design environment installation.

For the Interact runtime environment, the file is located in the `/tools/upgrade` directory under your Interact runtime environment installation.

## Environment variables required by the upgrade tool

The following tables describe the environment variables you must set for the Interact upgrade tools in the `setenv` files.

The environment variables for SSL upgrade are required for both the design and runtime environments.

The `setenv` file for the design environment is located in the `Interact_Design_Environment_Install_Directory/interactDT/tools/upgrade` directory.

The `setenv` file for the runtime environment is located in the `Interact_Runtime_Environment_Install_Directory/tools/upgrade` directory.

## Interact design environment

Variable	Description
JAVA_HOME	Root directory of the JDK used by your new Campaign 8.x installation.
JDBCDRIVER_CP	The path to the directory which contains the JDBC driver. This is the default path to the JDBC driver; you can override this path when running the upgrade tool.

Variable	Description
JDBCDRIVER_CLASS	The class for the JDBC driver. This is the default class to the JDBC driver; you can override this class when running the upgrade tool.
JDBCDRIVER_URL	The URL for the JDBC driver. This is the default URL for the JDBC driver; you can override this URL when running the upgrade tool.
ERROR_MSG_LEVEL	Desired logging level. Valid values, listed from most to least verbose. <ul style="list-style-type: none"> <li>• DEBUG</li> <li>• INFO</li> <li>• ERROR</li> <li>• FATAL</li> </ul>
LOG_TEMP_DIR	Directory where you want the migration tool to create log files.
LOG_FILE_NAME	The filename for the log file for the upgrade tool.

### Interact runtime environment

Variable	Description
JAVA_HOME	Root directory of the JDK used by your new Interact 8.x installation.
JDBCDRIVER_CP	The path to the directory which contains the JDBC driver. This is the default path to the JDBC driver; you can override this path when running the upgrade tool.
JDBCDRIVER_CLASS	The class for the JDBC driver. This is the default class to the JDBC driver; you can override this class when running the upgrade tool.
JDBCDRIVER_URL	The URL for the JDBC driver. This is the default URL for the JDBC driver; you can override this URL when running the upgrade tool.
ERROR_MSG_LEVEL	Desired logging level. Valid values, listed from most to least verbose. <ul style="list-style-type: none"> <li>• DEBUG</li> <li>• INFO</li> <li>• ERROR</li> <li>• FATAL</li> </ul>
LOG_TEMP_DIR	Directory where you want the migration tool to create log files.
LOG_FILE_NAME	The filename for the log file for the upgrade tool.

## Environment variables to support SSL upgrade (run time and design environments)

Variable	Description
IS_WEBLOGIC_SSL	Should the connection to the target system's server be via SSL? Valid values are YES and NO. If this value is set to NO, you do not need to set the remaining SSL properties.
BEA_HOME_PATH	The path to the location where the target system's WebLogic server is installed. This is required to point to the <code>license.bea</code> file in this path. If you are installing in a distributed environment where the target system's WebLogic server is not available locally to this script, copy the <code>license.bea</code> file locally to some folder, and specify the path to that folder using this variable.
SSL_TRUST_KEYSTORE_FILE_PATH	Path of the trust store used to configure SSL in the target system's WebLogic server. This is where the trusted certificates reside. Used for SSL handshake.
SSL_TRUST_KEYSTORE_PASSWORD	Password of the trust store used to configure SSL in the target system's WebLogic server. If there is no password, set it to "" or nothing. Used for SSL handshake.

## Run the upgrade tool for the design environment

Before running the upgrade tool, start the Web application server on the target system.

You must run the upgrade tool to update the Interact tables in the Campaign system tables. If you have multiple partitions, configure and run the upgrade tool once for each partition.

**!** The appropriate database client executable (`sqlplus`, `db2`, or `osql`) for the Campaign system tables data source must be accessible on the `PATH` of the user who will run the upgrade tool.

The latest versions of the upgrade tool (`aciUpgradeTool`) is located in the `/interactDT/tools/upgrade` directory under your Interact design environment installation. If your version is not listed, use the latest version available. Enter the requested information at the prompts to upgrade your system tables for the new version of Interact. When the tool completes successfully, your upgrade process is complete.

### Related Topics

- Information required for running the design environment upgrade tool (`aciUpgradeTool`)

## Information required for running the design environment upgrade tool (`aciUpgradeTool`)

Gather the following information about your Interact design environment installation before running the upgrade tool (`aciUpgradeTool`).

### **Target system configuration information**

- The name of the partition you are upgrading
- Directory of UNICA\_PLATFORM\_HOME
- Full path of the Campaign configuration file (`campaign_configuration.xml`). This file is located in the conf directory under your Campaign installation.

### **If you connect to the design environment system tables using the web application server, collect the following information.**

- Host name
- Port
- User name
- Password
- For WebLogic: Full path and file name of the WebLogic jar file

### **If you connect to the design environment system tables using JDBC, collect the following information.**

- Java class name for the JDBC driver
- JDBC URL
- Additional properties required by the JDBC driver
- Database username and password

### **Target design environment database information**

- Catalog (or database) containing the target design environment system tables
- Schema
- Whether or not the tables are configured for Unicode

### **Interact Design Time installation on source system**

- Version of Interact Design Time you are upgrading from

## **Run the upgrade tools for the runtime environment**

Before running the upgrade tools, start the Web application server on the target system.

You must run the upgrade tools to update the Interact tables in the runtime, learning, contact history, response history, and user profile tables.

The latest versions of the upgrade tools are located in the `/tools/upgrade` directory under your Interact runtime environment installation. If your version is not listed, use the latest version available. Enter the requested information at the prompts to upgrade your tables for the new version of Interact. When the tool completes successfully, your upgrade process is complete.

**!** Run these scripts only once for each server group.

You must run the tools in the following order.

1. Run `aciUpgradeTool_runtab` to update the `systemTablesDataSource` and the Interact runtime configuration properties.
2. ONLY if you are using built-in learning, run `aciUpgradeTool_lrntab` to update the `learningTablesDataSource`.
3. ONLY if you are using cross-session response tracking, modify the `/tools/upgrade/conf/ACIUpgradeTaskList_crhtab.properties` if necessary, then run `aciUpgradeTool_crhtab` to update the `contactAndResponseHistoryDataSource`.

Note that you need to modify the `ACIUpgradeTaskList_crhtab.properties` file only if you are upgrading from Interact version 8.x and the Interact runtime data source (as specified in the `Interact | general | contactAndResponseHistoryDataSource` configuration property) is **not** the same as the Campaign system tables data source. The properties file contains instructions for enabling the three required settings for this situation.

4. ONLY if you are using the `scoreOverride` or `defaultOffers` tables, run `aciUpgradeTool_usrtab` to update the `prodUserDataSource`.

## Redeploy Interact runtime server in the web application server

Redeploy the newly-installed version of Interact runtime server in your web application server.

## Upgrade existing interactive channels (only if upgrading from 7.5.x versions)

Interact 8.x allows table mapping in the interactive channel. This enables you to manage your user profile table mapping per interactive channel. However, you must re-map all your tables in your interactive channels before you can re-deploy your interactive channels. Immediately after completing an upgrade, your interactive flowcharts are disabled until you map your user profile tables in the interactive channel.

You can no longer map dimension tables in interactive flowchart processes. Any profile or dimension table you want to use must be mapped in the interactive channel. You can map a general table in a Snapshot process.

For instructions on performing these steps, see the *Interact User's Guide*.

After you map the user profile and dimension tables in the interactive channels, you must reconfigure your interactive flowcharts to use these mapped tables.

## Upgrade existing interactive flowcharts (only if upgrading from 7.5.x versions)

For upgrades from Interact 7.5.x versions only, after you re-map your tables in the interactive channel, you must reconfigure any process in your interactive flowchart that uses a table, such as Decision, Select, or Snapshot.

Immediately after completing an upgrade, your interactive flowcharts are disabled until you map your profile tables in the interactive channel and then reselect tables in your processes.

For instructions on performing these steps, see the *Interact User's Guide*.

After you re-select the tables in the processes, mark the flowchart for deployment and deploy your interactive channels.

---

✦ For upgrades from 7.x: A Interact 8.x runtime server is backwards compatible with a 7.5.x deployment. Do not deploy from a version 8.x design environment until you have also upgraded your runtime servers.

---

## Convert categories to templates (upgrades from 7.5.1 and 7.5.2 only; not applicable for upgrades from 7.5.3 to 8.x)

If you are upgrading your 7.5.1 or 7.5.2 installation to 8.x, follow the instructions here. Upgrades from 7.5.3 and later versions do not need these instructions.

After upgrading an Interact 7.5.x installation to 8.x, use the Marketing Platform `configTool` utility to convert the `contactAndResponseHistTracking` and `learningAttributes` categories on the Configuration page to templates. The `configTool` utility is located in the `tools/bin` directory of your Marketing Platform installation, and is called `configTool.bat` on a Windows server, and `configTool.sh` on a UNIX server.

1. Execute the following command to export the existing contact and response history and learning configurations:

```
configTool.bat -x -
p
"Affinium|Campaign|partitions|<partition_name>|Interact|contactAndResponseHistTracking" -f .\InteractCHRH.xml
```

```
configTool.bat -x -
p
"Affinium|Campaign|partitions|<partition_name>|Interact|learning|learningAttributes" -f .\InteractLearning.xml
```

2. In the `InteractCHRH.xml` file, change the template value to "true" as shown in the following example:

```
<?xml version="1.0" encoding="UTF-8"?>
<category id="3770" name="contactAndResponseHistTracking">
  <category id="3772" name="runtimeDataSources">
    <category id="3773" name="runtimeDataSource" template="true">
      <property id="3774" name="databaseType"
type="dropdown_property" width="40">
        <value selected="true"
predefined="true">SQLServer</value>
        <value selected="false"
predefined="true">DB2</value>
        <value selected="false"
predefined="true">ORACLE</value>
      </property>
    </category>
  </category>
</category>
```

3. In the `InteractLearning.xml` file, change the template value to "true" as shown in the following example:

```
<?xml version="1.0" encoding="UTF-8">
<category id="3792" name="learningAttributes">
  <category id="3793" name="learningAttributes" template="true">
    <property id="3794" name="attributeName" type="string_property"
width="40">
      </property>
    </category>
  </category>
</category>
```

4. Execute the following commands to import the updated configurations:

```
configTool.bat -i -o -
p "Affinium|Campaign|partitions|<partition_name>|Interact" -
f InteractCHRH.xml
```

```
configTool.bat -i -o -
p "Affinium|Campaign|partitions|<partition_name>|Interact|learning" -
f InteractLearning.xml
```

## Upgrade Interact API

After you have upgraded your runtime servers, you may need to rebuild your Interact API implementation, depending on the following conditions:

- If you upgraded your runtime servers from Interact 7.5x to the current release, you must rebuild your Unica Interact API implementation.

- If you upgraded your runtime servers from Interact 8.x, you do not have to rebuild your Interact API implementation.

Previous versions of the Interact API are backwards-compatible with the new version of the Interact API.

If you rebuild your Interact API implementation, make sure you are running against the new `interact_client.jar` located in the `lib` directory of your Interact runtime environment installation.

# A Uninstalling IBM Unica products

- Uninstalling IBM Unica products
- To uninstall Interact

## Uninstalling IBM Unica products

When you install IBM Unica Marketing products, an uninstaller is included in the `Uninstall_Product` directory, where *Product* is the name of your IBM Unica product. On Windows, an entry is also added to the **Add or Remove Programs** list in the Control Panel.

You may need to uninstall an IBM Unica product if you are doing the following.

- Retiring a machine.
- Removing an IBM Unica product from your machine.
- Freeing up space on a machine.

Running the IBM Unica uninstaller ensures that all configuration files, installer registry information, and user data are removed from the system. If you manually remove the files in your installation directory instead of running the uninstaller, the result may be an incomplete installation if you later reinstall an IBM Unica product in the same location.

## To uninstall Interact

In addition to the general instructions for uninstalling IBM Unica Marketing products, follow these guidelines when uninstalling Interact.

If you have multiple Interact runtime installations using the same Marketing Platform installation, you must remove network connectivity for the Interact runtime machine before running the uninstaller. Failure to do so will uninstall all of the configuration data for all other Interact runtime installations from Marketing Platform.

You can safely ignore any warnings regarding failure to unregister with Marketing Platform.

You may want to export a copy of your configuration as a precaution before uninstalling Interact.

If you choose to uninstall the Interact design environment, after you run the uninstaller, you may need to manually unregister Interact. Use `configtool` to unregister `full_path_to_Interact_DT_installation_directory\interactDT\conf\interact_navigation.xml`.

1. Undeploy the IBM Unica Marketing product web application from WebSphere or WebLogic.
2. Shut down WebSphere or WebLogic.
3. Run the IBM Unica Marketing uninstaller and follow the directions in the wizard.

The uninstaller is located in the `Uninstall Product` directory, where *Product* is the name of your IBM Unica Marketing product.

When you uninstall a product that was installed using unattended mode, the uninstall is performed in unattended mode (without presenting any dialogs for user interaction).
