Contacting IBM Unica technical support

If you encounter a problem that you cannot resolve by consulting the documentation, your company’s designated support contact can log a call with IBM® Unica® technical support. Use the information in this section to ensure that your problem is resolved efficiently and successfully.

If you are not a designated support contact at your company, contact your IBM Unica administrator for information.

Information to gather

Before you contact IBM Unica technical support, gather the following information:

• A brief description of the nature of your issue.
• Detailed error messages you see when the issue occurs.
• Detailed steps to reproduce the issue.
• Related log files, session files, configuration files, and data files.
• Information about your product and system environment, which you can obtain as described in “System information.”

System information

When you call IBM Unica technical support, you might be asked to provide information about your environment.

If your problem does not prevent you from logging in, much of this information is available on the About page, which provides information about your installed IBM Unica applications.

You can access the About page by selecting Help > About. If the About page is not accessible, you can obtain the version number of any IBM Unica application by viewing the version.txt file located under the installation directory for each application.

Contact information for IBM Unica technical support

For ways to contact IBM Unica technical support, see the IBM Unica Product Technical Support website: (http://www.unica.com/about/product-technical-support.htm).
Chapter 1. Administration in IBM Unica Campaign

You can access most administrative functions in Campaign from the Campaign Settings page, available from the Settings > Campaign Settings link. This page provides access to two main categories of administration tasks:

- **Templates and customization.** Provides access to pages for creating and managing the following types of objects:
  - Custom attributes for campaigns, offers, and cells
  - Templates for creating offers
- **Data source operations.** Provides access to pages for performing the following tasks:
  - Table mappings - manage user and system table mappings
  - Datasource access - manage and view details of your data sources
  - Dimension hierarchies - create and manage dimension hierarchies required in your business operation
  - Audience levels - create and manage audience levels required in your business operation
  - System log - view the Listener (aclsxr) log for the current session

Campaign-related administrative tasks in IBM Unica Marketing

Administrative tasks for Campaign that involve features or functions implemented across IBM Unica Marketing are performed in Marketing Platform. These include the following tasks:

- Managing users, groups, role assignments, security policies, and permissions
- Administering Windows impersonation
- Configuring proxy server authentication
- Managing configuration properties
- Configuring reporting
- Scheduling flowcharts with the IBM Unica Scheduler

For information on performing these tasks, see the *Marketing Platform Administrator’s Guide*. 
Chapter 2. Managing security in IBM Unica Campaign

Campaign uses the security functions of Marketing Platform to control user access to objects and features in Campaign. Administrators use the Marketing Platform security interface to configure the user accounts, group memberships, roles, and permissions required for users to access Campaign.

User access to the objects and features in Campaign is implemented using security policies.

About security policies

Security policies are the "rule books" that govern security in Campaign; they are consulted each time a user performs an action in the application. Security policies are created per partition (there is no sharing of security policies across partitions). A partition in Campaign can have multiple security policies.

A security policy consists of multiple roles that you define. Each role contains a set of permissions that determine the actions users can perform and the objects that they can access. You can assign users to a role directly, or assign groups to a role (users in those groups would be assigned the role).

When you create an object such as a campaign or offer in the top-level folder, you apply a security policy to the object. In addition, when you create a top-level folder, you apply a security policy to the folder, and any objects or subfolders you create within that folder inherit the security policy that you applied to the folder.

Applying security policies to objects or folders allows you to separate the objects in Campaign for use by different groups of users. For example, you could configure your security policies so that users belonging to one policy cannot access or even view objects that are associated with other policies.

You can create your own security policies or use the default global security policy included with Campaign.

The global security policy

Campaign includes a default global security policy that you can use as is or modify to suit the needs of your organization. If you choose not to create your own security policies, the global security policy is applied by default to the objects that you create in Campaign.

You can use the global policy in addition to your own policies, or use your own policies exclusively. You cannot delete the global policy, even if it is not in use.

Any security policies that you create exist under the global security policy. Under the global policy, you could create a separate security policy for employees of each division in your organization.

The global security policy contains six pre-defined roles; you can add roles to the global policy if needed. You cannot delete the pre-defined roles, but you can modify their permissions.
The pre-defined roles are:

- **Folder Owner** - All permissions enabled
- **Object Owner** - All permissions enabled
- **Admin** - All permissions enabled. The default user asm_admin is assigned this role.
- **Execute** - All permissions enabled
- **Design** - Read and write permissions on most objects. Cannot schedule flowcharts or sessions.
- **Review** - Read-only permissions

The global security policy applies to all users through the Owner and Folder Owner roles, including users who have not been assigned to any other specific role in the global policy. Because the global policy always applies, it can be used, for example, to globally deny permissions to a role.

**How Campaign evaluates permissions**

When a user performs a task or tries to access an object, Campaign performs the following steps:

1. Identifies all groups and roles to which this user belongs within the global security policy. A user can belong to one, many, or no roles. A user belongs to the Owner role if they own an object; they belong to the Folder Owner role if they own the folder in which an object resides. A user belongs to other roles only if they have been specifically assigned to that role (either directly or because they belong in a group assigned to that role).

2. Identifies whether the object being accessed has been assigned to a custom-defined policy, if any exist. If so, the system then identifies all groups and roles to which the user belongs within this custom policy.

3. Aggregates the permissions for all roles to which the user belongs, based on results from steps 1 and 2. Using this composite role, the system evaluates the permissions for the action as follows:
   a. If any roles have **Denied** permission for this action, then the user is not allowed to perform it.
   b. If no roles have **Denied** permission for this action, then it checks to determine whether any roles have **Granted** permission for this action. If so, the user is allowed to perform the action.
   c. If neither a nor b is true, the user is denied the permission.

**Using the Owner and Folder Owner roles**

By default, each security policy contains an Owner and a Folder Owner role with all permissions granted. These roles are created by default when you create a security policy. You can remove these roles from any custom-designed security policy, modify the permissions, or use the default permissions. You can modify the permissions for these roles in the global security policy, but you cannot delete them.

The Owner and Folder Owner roles apply to all users; you do not need to assign users to them. The Owner role applies to single objects that a user created. The Folder Owner role applies to all objects in a folder that a user owns.

These roles are useful for restricting users' access to objects that they do not own. For example, you could create a Read-Only role that grants only read permissions on all objects within the security policy. Assign all users to the Read-Only role. As
long as no other role explicitly denies permissions (for example, edit or delete), each user is allowed to edit or delete their own objects (under the Owner role) and objects in their own folders (under the Folder Owner role), but only view objects and folders owned by others (under the Read-Only role).

Guidelines for designing security policies

Follow these guidelines when designing security policies:

- **Keep the design simple.** Campaign allows you to create multiple security policies and roles, but you should keep the security design as simple as possible, and use as few policies and roles as possible to achieve your security needs. At the most minimal level, for example, you can use the default global security policy as is, without creating new roles or policies.

- **Avoid potential conflicts among security policies.** If your organization implements more than one security policy, keep in mind potential conflicts when designing the policies. For example, users with Move and Copy permissions in more than one security policy are able to move or copy objects and folders to locations across the policies in which they have these permissions. In doing so, because the moved objects or folders take on the security policy of their destination (if under another folder), they might cause situations where the rightful users in one division are no longer able to access the moved objects because they have no roles in the destination security policy, or where users with roles in the destination security policy who were not intended to access the objects, find that they now can.

- **Assign view permissions to allow users to modify objects.** To modify many of the objects in Campaign, users must be granted both view and modify permissions for the object. This requirement applies to the following objects:
  - campaigns
  - flowcharts
  - offers
  - offer lists
  - offer templates
  - sessions
  - strategic segments

Security scenarios

This section provides security model examples and explains how they are implemented in Campaign using security policies.

- “Scenario 1: Company with a single division”
- “Scenario 2: Company with multiple separate divisions” on page 7
- “Scenario 3: Restricted access within a division” on page 9

**Scenario 1: Company with a single division**

All of the employees in your company work with the same set of objects (campaigns, offers, templates, and so on). Sharing and re use of objects are encouraged; there is no need to make sure that groups of employees cannot access each other’s objects. You need to create sets of permissions that will determine employees’ ability to access, modify, or use these objects, based on their roles within the organization.

Solution
Only a single security policy is required, as objects do not have to be separated by group or division. In the existing global security policy, define roles corresponding to the employee jobs, and for each role, define the appropriate permissions for each object or function.

Table 1. Object permissions for this scenario

<table>
<thead>
<tr>
<th>Functions/Role</th>
<th>Manager</th>
<th>Designer</th>
<th>Reviewer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Campaigns</td>
<td>✔️</td>
<td>❌</td>
<td>❌</td>
</tr>
<tr>
<td>• Add Campaigns</td>
<td>✔️</td>
<td>✔️</td>
<td>❌</td>
</tr>
<tr>
<td>• Edit Campaigns</td>
<td>✔️</td>
<td>✔️</td>
<td>❌</td>
</tr>
<tr>
<td>• Delete Campaigns</td>
<td>✔️</td>
<td>✔️</td>
<td>❌</td>
</tr>
<tr>
<td>• Run Campaigns</td>
<td>✔️</td>
<td>❌</td>
<td>❌</td>
</tr>
<tr>
<td>• View Campaign Summary</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>

<tr>
<td>• Retire Offers</td>
<td>✔️</td>
<td>❌</td>
<td>❌</td>
</tr>
<tr>
<td>• View Offer Summary</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
</tbody>
</table>

For example, a Manager has full access and editing ability for campaigns and offers. A Reviewer can access campaigns and offers, but cannot add, edit, delete, or run them.

Optionally, you can also create user groups in IBM Unica Marketing that match these roles, and then assign user permissions simply by adding users to these groups.

The following table shows a sample subset of the object permissions for this scenario.

Table 2. Object permissions for this scenario

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Campaigns</td>
<td>✔️</td>
<td>❌</td>
<td>❌</td>
</tr>
<tr>
<td>• Add Campaigns</td>
<td>✔️</td>
<td>✔️</td>
<td>❌</td>
</tr>
</tbody>
</table>
Scenario 2: Company with multiple separate divisions

Your company has two business divisions, Eastern and Western, that do not share data between them. Within each division, people performing different functions need to access the same objects (campaigns, offers, templates), but with differing permissions to act on these objects, depending on their role.

Solution

Define two separate security policies, each with the appropriate roles and permissions. The roles in each security policy can be the same or different, depending on the needs of each division. Except for individuals who need to work across both divisions (for example, the controller, cross-divisional managers, or the CEO), assign each user to a role within only one policy. Do not assign any role to the users in the global policy. For users that work across both divisions, assign them a role in the global policy and grant them the desired permissions.

Create top-level folders that belong to each policy, to hold campaigns, offers, and so on. These folders are specific to each division. Users with roles in one policy cannot see the objects belonging to the other policy.

The following tables show only a sample subset of the possible object permissions in Campaign.
### Table 3. Eastern Division Security Policy

</tbody>
</table>

**Scenario 3: Restricted access within a division**

Employees within a division of your company require read access to the same set of objects (campaigns, offers, templates, and so on), but they are allowed to edit and delete only their own objects and objects in folders that they own.

**Solution**

Define a Read-Only role that grants only read permissions on objects. Assign all users within the division to this role. Keep the default permissions as defined for the Owner and Folder Owner roles.

**Note**: If your company requires only a single security policy, you can use the global policy and assign all users to the Review role.

Each user is allowed to edit or delete their own objects (under the Owner role) and objects in their own folders (under the Folder Owner role), but only view objects and folders owned by others (under the Read-Only role).

The following table shows a sample subset of the object permissions for this scenario.

Table 5. Object permissions for Scenario 3

<table>

Implementing security policies

This section describes how to create and delete security policies in Campaign and apply security policies to Campaign folders and objects.

Note: You must be assigned permission to administer the User Roles & Permissions page in Marketing Platform to work with Campaign security policies. In a multi-partition environment, only the platform_admin user, or another account with the PlatformAdminRole role, can work with security policies in all partitions.

To create a security policy

1. Click Settings > User Roles & Permissions. The User Roles & Permissions page displays.
2. Under the Campaign node, select the partition where you want to add a security policy.
3. Click Global Policy.
4. On the right of the page, click Add Policy.
5. Enter a policy name and description.
6. Click Save Changes.

The new policy is listed under the Global Policy on the User Roles & Permissions page. By default, the policy contains a Folder Owner role and an Object Owner role.

To delete a security policy

Use this procedure to delete any user-created security policies in Campaign that are not in use. You cannot delete the Global Policy.

Note: Do not delete any security policies that have been applied to objects in Campaign. If you need to delete a security policy that is in use, first set the security object of every object/folder using that security policy to a different policy (for example, the global policy). Otherwise, those objects might become inaccessible.

1. Click Settings > User Roles & Permissions.
   The User Roles & Permissions page displays.
2. Under the Campaign node, select the partition where you want to delete a security policy.
3. Click the plus sign next to Global Policy.
4. Click the policy that you want to delete.
5. Click Delete Policy.

   A confirmation dialog displays.

---

Table 5. Object permissions for Scenario 3 (continued)

<table>
<thead>
<tr>

<td>✔️</td>
<td>✔️</td>
<td>❌</td>
</tr>
<tr>
<td>View Offer Summary</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
</tbody>
</table>
6. Click OK to delete the policy.

Assigning security policies to folders or objects

When you create a top-level folder or object in Campaign, you must select a security policy for it. Only policies in which you have been assigned a role are available for you to associate with top-level objects or folders.

By default, all objects in Campaign are associated with the global policy, but you can assign an optional custom-defined policy.

Keep in mind the following rules when associating a folder or object with a security policy:

- **You cannot assign a security policy to objects within folders.** Objects automatically inherit the security policy of the folder in which they reside.

- **The top-level folder determines the security policy.** Objects within a folder, including sub folders, inherit the security policy of the parent folder. In other words, the security policy of the top-level folder determines the security policy of objects and subfolders within it. Therefore, you cannot manually assign a security policy to objects within folders. To change the security policy of an object, you must move the object into a folder with the desired security policy or into the top-level root folder.

- **Security policy changes when objects are moved or copied.** Objects and folders can be moved or copied across security policies, but the user performing the move or copy must have permissions to do so, in both the source and destination policies.

After an object or folder is moved or copied to a folder or location belonging to a different security policy than its source, the security policy of the lower-level objects or subfolders is automatically changed to the security policy of the new folder or location.

About administrative permissions in Campaign

Administrative permissions in Campaign are assigned for each partition. These administrative functions are different from the object-related functional permissions in security policies, including the global security policy. Users with these permissions can perform the allowed actions on any objects within the partition.

Each partition includes these four pre-defined roles:

- **Admin** — All permissions enabled. The default user asm_admin is assigned this role.

- **Execute** — Most permissions enabled, except for administrative functions such as performing cleanup operations, changing object/folder ownership, and managing global suppressions.

- **Design** — Same permissions as the Execute role.

- **Review** — Read-only access to all objects. For flowcharts, these users are allowed to access the edit mode of a flowchart, but save is not allowed.

You can add other administrative roles for each partition as needed.

The procedures for managing administrative roles and permissions in Campaign is the same as the procedures for managing roles and permissions in Marketing Platform.
To configure report folder permissions

In addition to controlling access to the Analytics menu item and the Analysis tabs for object types (campaigns and offers, for example), you can configure permissions for groups of reports based on the folder structure in which they are physically stored on the IBM Cognos® system.

1. Log in as a Campaign administrator who has the ReportSystem role.
2. Select Settings > Sync Report Folder Permissions.
   The system retrieves the names the folders located on the IBM Cognos system, for all partitions. (This means that if you decide to configure folder permissions for any partition, you must configure it for all of them.)
3. Select Settings > User Permissions > Campaign.
4. Under the Campaign node, select the first partition.
5. Select Add Roles and Assign Permissions.
6. Select Save and Edit Permissions.
7. On the Permissions form, expand Reports. The Reports entry does not exist until after you run the Sync Report Folder Permissions option for the first time.
8. Configure the access settings for the report folders appropriately and then save your changes.
9. Repeat steps 4 through 8 for each partition.

Reference: Administrative permissions in Campaign

Campaign includes administrative permissions in the following categories:

- Administration
- Audience Levels
- Data Sources
- Dimension Hierarchies
- History
- Logging
- Reports (folder permissions)
- System Tables
- User Tables
- User Variables

**Note:** You can set the permissions for all functions within a category by setting the permissions of the category heading.

### Administration

**Table 6. Administration (Administrative permissions)**

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Monitoring Area</td>
<td>Allows access to the Campaign Monitoring area.</td>
</tr>
<tr>
<td>Perform Monitoring Tasks</td>
<td>Allows performing of monitoring tasks in the Campaign Monitoring area.</td>
</tr>
<tr>
<td>Access Analysis Area</td>
<td>Allows access to reports in the Campaign Analytics area.</td>
</tr>
</tbody>
</table>
### Table 6. Administration (Administrative permissions) (continued)

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
</table>
| Access Optimizations
Link | If Optimize is installed, allows access to that application. |
| Run `svradm` Command Line Tool | Allows performing of administrative functions using the Campaign Server Manager (`unica_svradm`). |
| Run `genrpt` Command Line Tool | Allows running of the Campaign report generation utility (`unica_acgenrpt`). |
| Takeover Flowcharts in Edit Mode | Allows taking over control of flowcharts in **Edit** or **Run** mode from other users.  
**Note:** Taking over control of a "locked" flowchart locks out the other user and all changes in the flowchart since the last save are lost. |
| Connect to Running Flowcharts | Allows attaching to running flowcharts through Campaign Server Manager (`unica_svradm`) or the Campaign user interface. |
| Terminate Server Processes | Allows terminating the Campaign Server (`unica_acsvr`) using the Campaign Server Manager (`unica_svradm`). |
| Terminate Campaign Listener | Allows terminating the Campaign Listener (`unica_aclsnr`) using the Campaign Server Manager (`unica_svradm`) or using the `svrstop` utility. |
| Run `sesutil` Command Line Tool | Allows running of the Campaign session utility (`unica_acsesutil`). |
| Override Virtual Memory Settings | Allows overriding the Virtual Memory setting in flowchart Advanced Settings. |
| Access Custom Attributes | Allows access to and managing of custom attribute definitions from the Campaign Settings page. |
| Cell Report Access | Allows access to cell reports from the **Reports** icon on a flowchart **Edit** page. Excludes access to the Cell Content Report unless this permission is also explicitly granted. |
| Cell Report Export | If cell report access is granted, allows printing and exporting of cell reports. |
| Cell Content Report Access | Allows access to the Cell Content report from the **Reports** icon on a flowchart **Edit** page. |
| Cell Content Report Export | If Cell Content Report Export is granted, allows printing and exporting of the Cell Content report. |
| Perform Cleanup Operations | Allows performing cleanup operations using `unica_acclean` or a custom tool. |
| Change Object/Folder Ownership | Allows changing ownership of an object or folder. |

### Audience levels

**Table 7. Audience levels (Administrative permissions)**

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Audience Levels</td>
<td>Allows creation of new audience levels under <strong>Manage Audience Levels</strong> on the Campaign Settings page.</td>
</tr>
<tr>
<td>Delete Audience Levels</td>
<td>Allows deleting of existing audience levels under <strong>Manage Audience Levels</strong> on the Campaign Settings page.</td>
</tr>
</tbody>
</table>
### Table 7. Audience levels (Administrative permissions) (continued)

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manage Global Suppressions</td>
<td>Allows creation and configuration of global suppression segments in Campaign.</td>
</tr>
<tr>
<td>Disable Suppression in Flowchart</td>
<td>Allows clearing or selecting the Disable Global Suppressions for This Flowchart check box on the flowchart Advanced Settings dialog.</td>
</tr>
</tbody>
</table>

### Data sources

**Table 8. Data sources (Administrative permissions)**

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manage Datasource Access</td>
<td>Allows managing data source logins from the Administration area and within flowcharts.</td>
</tr>
<tr>
<td>Set Save with DB Authentication</td>
<td>Allow enabling the Save with Database Authentication Information flag in table catalogs and flowchart templates.</td>
</tr>
</tbody>
</table>

### Dimension hierarchies

**Table 9. Dimension hierarchies (Administrative permissions)**

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Dimension Hierarchies</td>
<td>Allows creation of new dimension hierarchies.</td>
</tr>
<tr>
<td>Edit Dimension Hierarchies</td>
<td>Allows editing of existing dimension hierarchies.</td>
</tr>
<tr>
<td>Delete Dimension Hierarchies</td>
<td>Allows deletion of existing dimension hierarchies.</td>
</tr>
<tr>
<td>Refresh Dimension Hierarchies</td>
<td>Allows refresh of existing dimension hierarchies.</td>
</tr>
</tbody>
</table>

### History

**Table 10. History (Administrative permissions)**

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log to Contact History Tables</td>
<td>Allows enabling or disabling logging to contact history tables when configuring contact processes.</td>
</tr>
<tr>
<td>Clear Contact History</td>
<td>Allows clearing entries from the contact history tables.</td>
</tr>
<tr>
<td>Log to Response History Tables</td>
<td>Allows enabling or disabling logging to response history tables when configuring the Response process.</td>
</tr>
<tr>
<td>Clear Response History</td>
<td>Allows clearing entries from the response history tables.</td>
</tr>
</tbody>
</table>

### Logging

**Table 11. Logging (Administrative permissions)**

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View System and Flowchart Logs</td>
<td>Allows viewing of flowchart logs and the system log</td>
</tr>
<tr>
<td>Clear Flowchart Logs</td>
<td>Allows clearing of flowchart logs.</td>
</tr>
</tbody>
</table>
Table 11. Logging (Administrative permissions) (continued)

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Override Flowchart Log Options</td>
<td>Allows override of default flowchart logging options.</td>
</tr>
</tbody>
</table>

Reports (folder permissions)

The Reports node appears on the partition permissions page after running Sync Report Folder Permissions from the Settings menu for the first time. The synchronize process determines the folder structure of the reports physically located on the IBM Cognos system, and then lists the names of those folders under this node.

The settings under this node grant or deny access to the reports in the folders that appear in the list.

System tables

Table 12. System tables (Administrative permissions)

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map System Tables</td>
<td>Allows mapping system tables.</td>
</tr>
<tr>
<td>Remap System Tables</td>
<td>Allows remapping system tables.</td>
</tr>
<tr>
<td>Unmap System Tables</td>
<td>Allows unmapping system tables.</td>
</tr>
<tr>
<td>Delete System Table Records</td>
<td>Allows deletion of records from system tables.</td>
</tr>
</tbody>
</table>

User Tables

Table 13. User tables (Administrative permissions)

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map Base Tables</td>
<td>Allows mapping base tables.</td>
</tr>
<tr>
<td>Map Dimension Tables</td>
<td>Allows mapping dimension tables.</td>
</tr>
<tr>
<td>Map General Tables</td>
<td>Allows mapping general tables.</td>
</tr>
<tr>
<td>Map Delimited Files</td>
<td>Allows mapping user tables to delimited files.</td>
</tr>
<tr>
<td>Map Fixed-Width Flat Files</td>
<td>Allows mapping user tables to fixed-width flat files.</td>
</tr>
<tr>
<td>Map Database Tables</td>
<td>Allows mapping user tables to database tables.</td>
</tr>
<tr>
<td>Remap User Tables</td>
<td>Allows remapping of user tables.</td>
</tr>
<tr>
<td>Unmap User Tables</td>
<td>Allows unmapping of user tables.</td>
</tr>
<tr>
<td>Recompute Counts and Values</td>
<td>Allows using Compute button in table mapping to recompute table counts and values.</td>
</tr>
<tr>
<td>Use Raw SQL</td>
<td>Allows the use of raw SQL in Select process queries, custom macros, and dimension hierarchies.</td>
</tr>
</tbody>
</table>
### User Variables

</thead>
<tbody>
<tr>
<td>Manage User Variables</td>
<td>Allows creating, deleting, and setting default values for user variables in flowcharts.</td>
</tr>
<tr>
<td>Use User Variables</td>
<td>Allows use of user variables in output files or tables.</td>
</tr>
</tbody>
</table>

---

#### Windows impersonation administration

This section contains the following information:

- “What is Windows impersonation?”
- “Why use Windows impersonation?”
- “What is the relationship between Campaign users and Windows users?”
- “The Windows impersonation group” on page 17
- “Windows impersonation and logging into IBM Unica Marketing” on page 17

### What is Windows impersonation?

Windows impersonation is a mechanism that allows Campaign administrators to associate Campaign users with Windows users, so that Campaign processes invoked by a Campaign user run under the credentials of the corresponding Windows user.

For example, if Windows impersonation is enabled, when the Campaign user jsmith edits a flowchart, a unica_acsvr process starts under the Windows user ID associated with the Marketing Platform login name, jsmith.

### Why use Windows impersonation?

By using Windows impersonation, you are able to leverage the Windows-level security permissions for file access. If your system is set up to use NTFS, you can then control access to files and directories for users and groups.

Windows impersonation also allows you to use Windows system monitoring tools to see which users are running which unica_acsvr processes on the server.

### What is the relationship between Campaign users and Windows users?

To use Windows impersonation, you must establish a one-to-one relationship between Campaign users and Windows users. That is, each Campaign user must correspond to a Windows user with the exact same user name.

Typically, administration begins with a set of existing Windows users who will use Campaign. You must create Campaign users in Marketing Platform with the exact same names as the associated Windows users.
The Windows impersonation group
Each Windows user for whom you have set up a Campaign user must be placed in a special Windows impersonation group. You must then assign the group to specific policies.

To ease administrative tasks, you can then grant read/write/execute privileges to the Campaign partition directory for the group.

Windows impersonation and logging into IBM Unica Marketing
When Windows impersonation is set up, once users have logged into Windows, Campaign users are automatically logged into IBM Unica Marketing using a single sign-on. When they open a browser and go to the IBM Unica Marketing URL, they do not need to log in again, and immediately see the IBM Unica Marketing start page.

Working with Windows impersonation
Setting up Windows impersonation involves the following tasks, described in this section:
• “Set the Windows impersonation property”
• “Create Campaign users”
• “Create the Windows impersonation group”
• “Assign the Windows impersonation group to policies” on page 18
• “Assign rights to the Windows impersonation group” on page 18

Note: LDAP and Active Directory are required to run Windows impersonation. For details about setting up LDAP and Active Directory, see the IBM Unica Marketing Platform Administrator’s Guide.

Set the Windows impersonation property
On the Configuration page, set the value of the enableWindowsImpersonation property in the Campaign > unicaACLsListener category to TRUE.

Note: There might be additional property requirements based on your Windows Domain Controller setup. For more information, see the single sign-on section of the Marketing Platform Administrator’s Guide.

Create Campaign users
You can use Marketing Platform to create Campaign internal or external users.

Create external users by configuring Active Directory users and group synchronization. Each user you create must have the same login name as the user’s Windows user name.

Create the Windows impersonation group
Note: You must have administration privileges on the Windows server to complete this task.

Create a Windows group specifically for Campaign users. Then add the Windows users that correspond to Campaign users to this group.

For more information about creating groups, see your Microsoft Windows documentation.
Assign the Windows impersonation group to policies

Note: You must have administration privileges on the Windows server to complete this task.

After you create a Windows group to store users that correspond to Campaign users, you must add the group to the following policies:
- Adjust memory quotas for a process
- Create Token object
- Replace a process level token

For more information about assigning groups to policies, see your Microsoft Windows documentation.

Assign rights to the Windows impersonation group

Using Windows Explorer, grant "read/write/execute" access to the partitions/partition_name folder under your Campaign installation to the Windows impersonation group.

For more information about assigning rights to folders, see your Microsoft Windows documentation.

About support of Proxy Server Authentication

Proxy Server Authentication support is available for customers who want to configure and run Campaign so that all internet traffic is required to pass through a proxy server. This feature enables the Active-X component for Campaign to connect through a proxy server that requires authentication, and automatically pass (per-user) stored credentials. You can configure access through a proxy using the following authentication mechanisms:
- Basic
- Digest
- NTLM (NT LAN Manager)
- Negotiate (may resolve to either Kerberos or NTLM)

Note: The actual version of the mechanisms supported is determined by the Internet Explorer browser.

About support for local area network settings in the browser

The Active-X component supports the Internet Explorer (IE) options for Local Area Network (LAN) settings for:
- Automatic configuration, including options to automatically detect settings and to use a Proxy Auto Configuration (PAC) script as an automatic configuration script.
- Proxy server, including options to use a proxy server for your LAN, to bypass proxy server for local addresses, and advanced settings for the HTTP proxy address and port as well as exceptions.

Note: The Active-X component requires the PAC file address, if provided, to use either the http or https scheme (for example, http://machine:port/proxy.pac). Although IE recognizes the file scheme (for example, file://C:/windows/proxy.pac), the Active-X component fails to locate the PAC file if the file scheme is
used. The Active-X component might also be unable to locate the PAC file if authentication is required, for example if the PAC file is served by a web server that requires authentication.

To set authentication credentials for a virtual data source named proxy

For each Campaign user, in the Marketing Platform you must set authentication credentials (user name and password) for a virtual data source named "proxy". These credentials are used to connect to the proxy server.

1. On the Settings > Users page, add a data source named proxy for each Campaign user.
2. Set the user name and password for the proxy data source to the proxy server’s user name and password.

Note: The data is automatically encrypted when stored in the Marketing Platform; however, the data is only encoded (not encrypted) when passed from the Web server to the Active-X implementation. If additional security is required for this communication, you must configure Campaign to use SSL.

Note: If the user name or password for the proxy server change, the user must update these authentication values to match by editing the values for the "proxy" data source for each user.
Chapter 3. Database table administration

As a Campaign administrator, you must:

- Map Campaign system tables, if this is not done during Campaign installation.
- Map user tables so that customer data can be used by Campaign flowcharts.

In addition, as an administrator, you work with:

- Data dictionaries, which define the structure of user tables based on fixed-width flat files
- Table catalogs, which enable the efficient management of mapped user tables

Table administration concepts

This section describes the following table administration concepts:

- “What are system tables?”
- “What are user tables?”
- “About mapping tables” on page 22
- “What is a data dictionary?” on page 23
- “What is a table catalog?” on page 23

What are system tables?

System tables are database tables containing Campaign application data. Specifically, system tables store meta data on campaign objects, such as campaigns, sessions, flowcharts, offers, templates, custom macros, stored derived fields, triggers. Contact and response history information is also stored in system tables.

The Campaign installation and configuration process includes setting up the Campaign system tables. For more information, see the installation documentation.

What are user tables?

User tables are tables containing data that you use in processes within a flowchart. You can map user tables to tables in a relational database or to ASCII flat files.

Note: Before mapping a user table in Campaign, ensure that the table uses only data types that Campaign supports. For a list of supported data types for each database, see Appendix C, “Supported data types for user tables,” on page 319.

Typically, a user table contains data about your company’s customers, prospects, or products. For example, a user table might contain columns for customer account data such as Account ID, Account Type, and Balance. You might want to use this data in a campaign that targets customers with certain account types and balances.

You work with three types of user tables, described below:

- Base tables
- Dimension tables
- General tables
What is a base record table?
A base record table is a table that contains data about potential contacts of campaigns, such as individual customers, businesses, accounts, or households.

Each base record table can be mapped to either a database table or an ASCII flat file (fixed-width or delimited) and must contain an identifier for that contact; that is, there must be one or more columns, which together store a unique identifier for the audience entity. These columns cannot be null for any record in the table.

You map the identifier in the base record table to one or more audience levels.

Processes in a flowchart select these audience level identifiers from base record tables when campaigns run.

What is a dimension table?
A dimension table is a database table that augments the data in a base record table mapped to a database table.

Note: Dimension tables cannot be mapped to flat files and they cannot be joined to base tables mapped to flat files. Dimension tables and their corresponding base tables must be mapped to database tables in the same physical database (that is, the same data source).

For example, a dimension table might contain demographic information based on zip code, accounts belonging to a customer, or the customer’s transactions, product information, or purchase transaction details.

When you define a dimension table, you specify the key fields for joining the dimension table to the base record table.

What is a general table?
A general table is a free-format table to which you can export data from Campaign. It is the simplest table type that can be created and is used only to export data from Campaign for use by other applications (general tables cannot be subsequently accessed in Campaign, unless you map them as base tables).

You can define a general table in a relational database, as a delimited flat file, or as a flat file with a data dictionary. General tables do not have keys or audience levels.

You use general tables in the Snapshot process to capture campaign data for use by other applications. For example, you can define the Snapshot process to store historical data or mailing lists in the exported general table.

You use general tables only to export data; you cannot query or manipulate data in general tables in Campaign.

About mapping tables
Mapping tables is the process of making external customer or system tables accessible in Campaign.

A table mapping is the metadata used to define a base, dimension, or general table. It contains information on the data source, the table name and location, the table fields, audience levels, and data. Table mappings can be stored for re-use in table catalogs.
What is a data dictionary?

A data dictionary is a file that defines the format of data in a fixed-width ASCII flat file used in Campaign either as a base table or as a general table.

A data dictionary is required to interpret the structure and format of a fixed-width ASCII text file. It defines the field names, their order, their data type (string or numeric) and the byte positions they occupy in the file. Data dictionaries are automatically created for fixed-width flat files created by Campaign and these typically do not need to be manually created or edited.

You use data dictionaries in output processes such as Snapshot, Mail List, and Call List to ensure that the flat file tables you create adhere to a specific structure.

A data dictionary defines the table fields, data types, and sizes. You can develop data dictionaries for vendor or channel-specific output and re-use them to create output of a pre-determined format.

If you are using a fixed-width flat file created by a non-Unica third-party application, you may need to manually or programmatically create an associated data dictionary. Or you may want to copy an existing data dictionary and edit it to create a new file. You also can edit a data dictionary to change field names. You must be sure that you are not corrupting data if you choose to edit any of the other fields in the data dictionary.

What is a table catalog?

A table catalog is a collection of mapped user tables.

Table catalogs store all the user table mapping meta data information for re-use across flowcharts. Table catalogs are stored by default in a proprietary binary format using a .cat extension. For more details, see “Stored table catalogs overview” in the Campaign User’s Guide.

You can also store (and subsequently load) a table catalog in XML format by providing a table catalog name ending with a .XML extension. Saving a table catalog as XML makes it possible to view and interpret the values. XML format is especially useful for editing purposes. A common use of the XML format is to globally search and replace all references to a production data source name with a test data source name. This makes it easy to make table catalogs portable between data sources.

You use table catalogs to:
- Easily save, load, and update your commonly used user tables.
- Create alternative data mappings (for example, to switch between running against a sample database and the production database).

You can save mapped user tables to a table catalog, then use the same table catalog in other flowcharts. This means you can:
- Make changes to the table catalog in one flowchart, then propagate these changes to other flowcharts by importing the updated table catalog into each flowchart.
- Retain the internal catalog you first loaded for that flowchart, although you copy it to other flowcharts and make changes there.
- Make different changes to the internal catalogs of a number of different flowcharts, starting from one “template” table catalog.
Initial table administration tasks

This section describes the following initial table administration tasks to be performed after installation of Campaign:

- “Prerequisites: expected state following installation”
- “To test system table access”
- “To test user table access” on page 25
- “Mapping Customer audience level system tables” on page 25

Prerequisites: expected state following installation

The initial administration tasks described in this section assume that the Campaign installation is complete, including:

- Setup and configuration of the Campaign system database
- Configuration of Campaign to access any databases containing user tables (that is, the data sources are defined)

For more information about these tasks, see the installation documentation.

In addition, you should define necessary audience levels before beginning to work with user tables, as you need to specify audience levels related to your base tables.

For instructions on confirming that the Campaign system is ready for you to begin the table administration tasks, see:

- “To test system table access”
- “To test user table access” on page 25
- “Mapping Customer audience level system tables” on page 25

To test system table access

You should confirm that the Campaign system tables are mapped and that database connections are working properly.

1. Select Settings > Campaign Settings. The Campaign Settings page opens, presenting links for various administration tasks.
2. In the Data Source Operations section, click Manage Table Mappings.
   The Table Mappings window opens, with Show System Tables selected.
   The Campaign system tables are mapped automatically when you set up the Campaign database, provided you use UA_SYSTEM_TABLES as the ODBC name. For more information, see the installation documentation.
   Each Unica system table entry should have a populated database table name in the right column, though it is possible that your implementation does not use particular features, which may leave some system tables unmapped.
   If you cannot confirm that the system tables are mapped, contact the person who performed the Campaign installation and configuration.
To test user table access

You should confirm that Campaign is configured properly to access the necessary user tables.

1. Select **Settings > Campaign Settings**. The Campaign Settings page opens, presenting links for various administration tasks.

2. In the **Data Source Operations** section, click **Manage Table Mappings**. The Table Mappings window opens, with **Show System Tables** selected.

3. Select **Show User Tables**. Initially, there are no mapped user tables and the list is empty.

4. Click **New Table**. The New Table Definition window opens.

5. Click **Next**.

   You are prompted to specify whether to map to a file or database.

   When **Map to Existing Table in Selected Database** is selected, you should see one or more databases in the **Select Data Source** list. If no entries appear in the Select Data Source box, you must define the data sources. For more information, see the installation documentation.

6. If Campaign is using one or more flat files for user data:
   a. Select **Map to Existing File**, then click **Next**. The New Table Definition window now contains fields for the flat file and data dictionary location.
   b. Click **Browse** to locate the necessary files, or enter the relative path and file name directly into the text box. Files must be located under the partition root of Campaign to be accessible.

   You can now map the user data into Campaign, as described in “Working with user tables” on page 28.

You can also view the customer databases that Campaign is set up to access when editing a flowchart. Click **Settings > Campaign Settings** and select **View Datasource Access**. The **Database Sources** window opens, listing the system table database, and all configured customer databases. From this window, you can log into and log out of customer databases.

Mapping Customer audience level system tables

Campaign is delivered with the Customer audience level. The system database tables to support the Customer audience level are created when you run the provided system table creation script, as described in the installation documentation.

However, the Customer audience level tables are not mapped following installation. You must map these tables as follows:

<table>
<thead>
<tr>
<th>Unica system table</th>
<th>Database Table to Map to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customer Contact History</td>
<td>UA_ContactHistory</td>
</tr>
<tr>
<td>Detailed Customer Contact History</td>
<td>UA_DtlContactHistory</td>
</tr>
<tr>
<td>Customer Response History</td>
<td>UA_ResponseHistory</td>
</tr>
<tr>
<td>Customer Segment Membership</td>
<td>UA_SegMembership</td>
</tr>
</tbody>
</table>

Chapter 3. Database table administration
About mapping segment membership tables

The segment membership table is one of the audience level system tables that Campaign creates when you define a new audience. If you use strategic segments in Campaign flowcharts or Optimize sessions within Optimize, you must map the segment membership table to a database table that defines segment members.

For example, if you plan to use the default Customer audience in conjunction with strategic segments, you must map the Customer Segment Membership system table to the UA_SegMembership segment membership database table. For other audiences used with strategic segments, you would map the system table <audience name> Segment Membership to the database table that defines the segment members. You can use UA_SegMembership as a template for the database table.

Running the Create Seg process populates a database table if you have mapped it to a segment membership system table. If you run the Create Seg process when the database table is not mapped to the segment membership system table, you must re-run the Create Seg process to populate the table if you map it later. Otherwise, Optimize sessions in Optimize that use strategic segments may provide inaccurate results.

If you are not using strategic segments in flowcharts or Optimize sessions

Using strategic segments in Campaign flowcharts and Optimize sessions is optional. If you are not using strategic segments, the best practice is that you do not map the segment membership table. Mapping an audience's segment membership system table causes Campaign or Optimize to refresh the table each time you run the flowchart or Optimize session that includes the audience. This is unnecessary processing overhead if you are not using strategic segments.

Working with system tables

This section contains the following information:

- “To map or re-map a system table”
- “To unmap a system table” on page 27
- “To view system table contents” on page 27

To map or re-map a system table

Most system tables are mapped automatically during initial installation and configuration if you use the recommended system table data source name, UA_SYSTEM_TABLES. For more information, see the installation documentation. If you need to map system tables, continue with these instructions.

Important: You should only map or remap system tables when no users are using Campaign.

1. Select Settings > Campaign Settings. The Campaign Settings page opens, presenting links for various administration tasks.
2. In the Data Source Operations section, click Manage Table Mappings. The Table Mappings window opens.
3. Select Show System Tables.
4. Select the table to map from the Unica system table list and double-click it or click Map Table or Re-Map Table. The Select source database and match required fields window opens.
5. If the table is not automatically selected in the **Source Table** drop-down list, select it (entries are alphabetically listed by owner.table names). Source table fields in the Campaign database are automatically mapped to required fields. For system tables, you do not need to add or remove any field mappings; all field entries should be matched automatically.

**Note:** When mapping a system table, do not select a different table from the Source Table list; you will not be able to complete the mapping. If you do this accidentally, click Cancel and select a the correct table in the Table Mappings window.

6. Click **Finish**.

**To unmap a system table**

**Important:** Unmapping a system table without re-mapping it can cause significant application problems. Unmapping a system table can cause features and existing campaigns to stop working.

**Important:** You should only unmap system tables when no users are using Campaign.

1. Select **Settings > Campaign Settings**. The Campaign Settings page opens, presenting links for various administration tasks.
2. In the **Data Source Operations** section, click **Manage Table Mappings**. The Table Mappings window opens.
3. Select **Show System Tables**.
4. Select the table to unmap in the **Unica system table** list, then click **Unmap Table**. You are prompted to confirm the unmapping.

You should immediately remap the system table or be sure that it does not need to be mapped in your environment.

**To unmap the segment membership table**

When you unmap the segment membership table you must also clear existing cache files and restart the Campaign and Optimize listeners.

**Note:** If you are using Optimize, do not change the mapping of the segment membership table for an audience while an Optimize session that uses the audience is running.

1. In Campaign, unmap the segment membership table for the audience.
2. Delete `unica_tbmgr.cache` from the `conf` directory of your Campaign installation.
   
   By default, this file is located at `Campaign\partitions\<partition[n]\>\conf`.
3. Delete `unica_tbmgr.cache` from the `conf` directory of your Optimize installation.
   
   By default, this file is located at `Optimize\partitions\<partition[n]\>\conf`.
4. Restart the Campaign listener (`unica_aclsnr`).
5. Restart the Optimize listener (`unica_aolsnr`).

**To view system table contents**

You can view the contents of mapped system tables.
For convenience, you can view the contents of most system tables from within Campaign's table manager. You cannot edit the system table data.

You can only view the first 1000 rows of data in a table. Therefore, this function is of limited use for very large tables such as contact and response history tables.

1. Select Settings > Campaign Settings. The Campaign Settings page opens, presenting links for various administration tasks.
2. In the Data Source Operations section, click Manage Table Mappings. The Table Mappings window opens.
3. Select Show System Tables.
4. Select the system table whose contents you want to view.
5. Click Browse.

   A window opens showing the table data.
   You can sort by any column in ascending order by clicking on it. Clicking on the column again will toggle the sort order.

To close the window, click the X in the upper-right corner.

Working with user tables

This section contains the following information:
- “About working with user tables”
- “To access data sources from within a flowchart” on page 29
- “Working with user tables while editing a flowchart” on page 29
- “Working with user tables from the Campaign Settings page” on page 30
- “To map a base record table to an existing database table” on page 30
- “Mapping a base record table to an existing file” on page 32
- “To map a dimension table” on page 34
- “To map a general table to a database table” on page 35
- “To map a general table to a file” on page 36
- “Re-mapping user tables” on page 37
- “Profiling values and counts” on page 37
- “To unmap a user table” on page 38
- “To create a new user table through an output process” on page 39

Note: You should define necessary audience levels before beginning to work with user tables, as you need to specify audience levels related to your base tables.

About working with user tables

Typically, most of the marketing data you will access from a flowchart will reside in a DB, but it may be convenient to access data directly from a flat file. Campaign supports the ability to work with data stored in either delimited ASCII flat files or fixed-width ASCII flat files with a data dictionary. You can map flat files as base tables and access them from within a flowchart; you cannot map flat files as dimension tables.

Direct access to flat files removes the need to first upload data into a database to use with Campaign. This is useful for data exported from third-party applications.
(such as Excel or SAS) and for transient, one-time use data (such as a campaign-specific seed list, last-minute suppressions, predictive model scores, and other uses).

**Guidelines for mapping user tables**

Follow these guidelines for mapped table and field names:

- Do not include spaces in the name.
- Begin the name with an alphabetic character.
- Do not use any unsupported characters. For more information about unsupported characters and naming restrictions for Campaign objects, see Appendix B, “Special characters in Campaign object names,” on page 317.
- Do not to use function names or keywords from the Unica Macro Language for column headings on tables mapped from a database or a flat file. These reserved words can cause errors if used in column headings on mapped tables. For details about these reserved words, see the *Unica Macros for Unica Marketing User’s Guide*.
- Field names are not case-sensitive. If a field has been mapped, you can change the case in the field name without affecting the mapping.

**To access data sources from within a flowchart**

To access the customer or prospect database tables from within a flowchart, you must ensure that you are logged in to the referenced databases.

1. While editing a flowchart, click the Admin icon and select Database Sources.
   The Database Sources window opens. The database containing system tables is listed, as well as all databases for which Campaign is configured to access.
2. To log into a database, select it and click Login.
3. Click Close.

You now have access to tables in that database. To query a table in that database, you must map that table, as described in the next section.

**Working with user tables while editing a flowchart**

You can work with user tables while editing a flowchart by:

- Using the Admin menu
- Mapping a new user table through the Select process
- Exporting data to a base or general table through Snapshot, Call List, and Mail List processes

**Working with user tables by using the Admin menu**

Click the Admin icon and select Tables. The Table Mappings window opens, showing a list of mapped user tables.

The following are the tasks you can then perform:

- “To map a base record table to an existing database table” on page 30
- “Mapping a base record table to an existing file” on page 32
- “To map a dimension table” on page 34
- “To map a general table to a database table” on page 35
- “To map a general table to a file” on page 36
- “Re-mapping user tables” on page 37
Working with user tables from the Select process

In the Source tab of a Select process, in the Input drop-down list, select New Table. The New Table definition window opens.

The following are the tasks you can then perform:
- “To map a base record table to an existing database table”
- “Mapping a base record table to an existing file” on page 32
- “To unmap a user table” on page 38

Working with user tables from exported data

You can create new user tables from output processes.

Working with user tables from the Campaign Settings page

Select Settings > Campaign Settings. The Campaign Settings page opens.

Then click Manage Table Mappings. The Table Mappings window opens.

You can then perform the following tasks:
- “To map a base record table to an existing database table”
- “Mapping a base record table to an existing file” on page 32
- “To map a dimension table” on page 34
- “To map a general table to a database table” on page 35
- “To map a general table to a file” on page 36
- “Re-mapping user tables” on page 37
- “To unmap a user table” on page 38

Note: Before mapping a user table in Campaign, ensure that the table uses only data types that Campaign supports. For a list of supported data types for each database, see Appendix C, “Supported data types for user tables,” on page 319.

To map a base record table to an existing database table

You can map a new base record table to an existing database table:
- When editing a flowchart, either through the Admin menu, or a Select process, as described in “Working with user tables while editing a flowchart” on page 29.
- Through the Campaign Settings page, as described in “Working with user tables from the Campaign Settings page.”

You map a new base record table to make data accessible to processes in flowcharts.

1. Begin from the New Table Definition - Select the table type window.

   Note: When you access the table mapping wizard from a Select process, the Dimension Table and General Table options are not listed.

2. If necessary, select Base Record Table, then click Next.

3. Select Map to Existing Table in Selected Database, select the data source name, then click Next.

4. Select the table you want to map from the Source Table list.

   The tables are listed in alphabetical order by <owner>.<table_name>. If you do not see a table you expect, check whether the data source is configured to filter specific table entries.
The source fields in the table you select are mapped automatically to new table fields in the base record table you are creating. To change the automatic mappings, select fields from the **Source Table Fields** list or the **New Table Fields** List, and use the **Add**, **Remove**, **Up 1**, an **Down 1** buttons, until the table is mapped as required.

You can click on the **Field Name** column in the **New Table Fields** section to automatically sort column names alphabetically in ascending (or descending) order.

5. **Click Next**.

6. Optionally, you can change the name which Campaign will use for the base record table and its fields to a more user-friendly value.
   a. To change the table name, edit the name in the **Unica Table Name** field.
   b. To change a field name, select the field name in the **New Table Fields** list, and edit the text in the **Unica Field Name** field.

7. **Click Next**.

8. Select an **Audience Level** from the drop-down list. The **Audience Fields** list is automatically populated with the fields required to define the selected audience level. You must match one or more fields in the new base table that correspond to each required key.

9. If the selected audience level is normalized (if each unique audience ID appears no more than once in the current base table), check **This audience level is normalized in this table**.

   Setting this option correctly is important for correct configuration of options in an **Audience** process. If you don’t know the correct setting, leave this option unchecked.

10. **Click Next**.

11. Optionally, in the Specify Additional audience levels screen, you can specify one or more additional audience levels contained in the base record table. Adding additional audience levels allows users to use this table as a “switching table” to translate from one audience level to another using the **Audience** process in a flowchart.
   a. Click **Add**. The Audience Level and ID Fields window opens.
   b. Select an **Audience Level Name**.
   c. For each **Audience Field**, match appropriate field(s) from the base table to the corresponding key(s) in the audience level.
   d. If the selected audience level is normalized (that is, each unique audience ID appears at most once in the current base table), check **This audience level is normalized in this table**.
   e. Click **OK**.
   f. Repeat steps a through f for each audience level you want to add for the base table, then click **Next**.

12. If dimension tables exist in the current table catalog, the Specify Relationship to Dimension Tables window opens:
   a. Check the box to the left of any dimension table that is related to the base record table you are creating.
   b. For each related dimension table, in the **New Table's Key Fields(s) To Use** list, select a field from the base table to match each listed key in the **Dimension Table's Key Field(s)** list, then click **Next**.

13. You can choose to pre-compute the distinct values and frequency counts for specific fields, or allow users to perform real-time profiling of data in the base record table.

Chapter 3. Database table administration  31
14. Click Finish.

You have created the base record table based on an existing database table. The new base table is part of the current table catalog, which you can manage through the table manager.

**Mapping a base record table to an existing file**

You can map a new base record table to an existing file on the Campaign server within your partition (that is, the file must be located under your partition root):

- When editing a flowchart, either through the **Admin** menu, or a Select process, as described in “Working with user tables while editing a flowchart” on page 29.
- Through the Campaign Settings page, as described in “Working with user tables from the Campaign Settings page” on page 30.

You map a new base record table to make data accessible to processes in flowcharts.

**To map a base record table to a file:**

1. Begin from the **New Table Definition - Select the table type** window.
2. If necessary, select **Base Record Table**, then click **Next**.
3. Select **Map to Existing File**, then click **Next**.
4. Specify the type of file and mapping settings.

**To map a base record table to an existing fixed-width flat file:**

You can map a new base record table to an existing file on the Campaign server within your partition (that is, the file must be located under your partition root):

- When editing a flowchart, either through the **Admin** menu, or a Select process.
- Through the Campaign Settings page.

You map a new base record table to make data accessible to processes in flowcharts.

1. Begin from the **New Table Definition - Select the table type** window.
2. If necessary, select **Base Record Table**, then click **Next**.
3. Select **Map to Existing File**, then click **Next**.
4. Keep the default **File Type** selection of **Fixed-Width Flat File**.
   The Settings section of the window appears.
5. In the Settings section of the window, click **Browse** to select the **Source File** from within your campaign partition root directory. Campaign automatically populates the **Dictionary File** field with the same path and file name, except with the .dct extension. You can override this entry if necessary.

**To map a base record table to an existing delimited file:**

You can map a new base record table to an existing file on the Campaign server within your partition (that is, the file must be located under your partition root) when editing a flowchart or through the Campaign Settings page.

You map a new base record table to make data accessible to processes in flowcharts.

1. Begin from the **New Table Definition - Select the table type** window.
2. If necessary, select **Base Record Table**, then click **Next**.
3. Select Map to Existing File, then click Next.
4. Select Delimited File for the File Type.
5. In the Settings section of the window, check First Row of Data Contains Field Names if this is the case. This automatically uses the first row of data to define the fields of the base table. You can override these values later.
6. Select the Field Delimiter (this is the character used to separate each field in a row of data): TAB, COMMA, or SPACE.
7. Select the Qualifier used to indicate how strings are delimited in the file: None, Single Quote, or Double Quote.
   This is important if you have a space-delimited file with spaces as part of a field entry. In this case, the field must be enclosed in quotation marks so the embedded spaces are not interpreted as field delimiters. For example, if you had a row of data such as: "John Smith" "100 Main St.", with the delimiter as SPACE and Qualifier set to NONE, Campaign would parse this as five different fields ("John" as the value of the first field, "Smith" as the second, "100" as the third, and so forth). If the qualifier is set to Double Quote, then this record is correctly parsed as two fields (name and street address).
   
   Important: Campaign does not support the use of the double quote character (") in field entries of delimited files. If any of your field entries contain double quotes, change them to another character before mapping a table to the file.
8. Click Browse to select the Source File from within your partition directory.
9. Specify the fields to use in the new table. By default, all fields in the file are listed.
   If you are mapping a delimited file, the first 50 lines of the file will be sampled for field type and width. You can override the field type (Numeric or Text) and the width, which are automatically detected. For example, if the IDs in the first 50 lines are detected to be 2 characters wide, but you know that IDs later in the file consist of up to 5 characters, increase the value to 5.
   
   Important: If the width value is too small, an error may occur.
   You use the Add, Remove, Up 1 and Down 1 buttons to specify the Source Table Fields that are included in the new table and their order. Click on the Field Name column in the New Table Fields section to automatically sort column names alphabetically in ascending (or descending) order.
10. When finished, click Next. The Specify table name and field information screen opens.
11. Accept the defaults, or edit the Unica Table Name field to change the name of the table as it will appear in Campaign. You can also change the Unica Field Name mapped to each source field name by selecting the field name and editing the text in the Unica Field Name text box in the Edit Selected Field Information section.
12. When your changes are complete, click Next. The Specify the selected table’s audience level and assign ID field(s) to it screen opens.
13. Select an Audience Level from the drop-down list. The Audience Fields list is automatically populated. You must select a field in the new base table that is the corresponding key for each listed entry.
15. Optionally, in the Specify Additional audience levels screen, you can specify one or more additional audience levels contained in the base record table.
Adding additional audience levels allows users to use this table as a “switching table” to translate from one audience level to another using the Audience process in a flowchart.

1. Click Add. The Audience Level and ID Fields window opens.
2. Select an Audience Level Name.
3. For each Audience Field, match appropriate field(s) from the base table to the corresponding key(s) in the audience level.
4. If the selected audience level is normalized (that is, each unique audience ID appears at most once in the current base table), check This audience level is normalized in this table.
5. Click OK.
6. Repeat steps a through f for each audience level you want to add for the base table, then click Next.

You can choose to pre-compute the distinct values and frequency counts for specific fields, or allow users to perform real-time profiling of data in the base record table.

16. Click Finish. You have created the base record table based on an existing file. The new base table is part of the current table catalog, which you can managed through the table manager.

To map a dimension table

You can map a new dimension table based on an additional table:

- When editing a flowchart, through the Admin menu, as described in “Working with user tables while editing a flowchart” on page 29.
- Through the Campaign Settings page, as described in “Working with user tables from the Campaign Settings page” on page 30.

You map a new dimension table to make data that augments data in a base table, such as demographics based on postal codes, accessible to processes in flowcharts.

Dimension tables must be mapped to a database table and must be related to one or more base tables that are mapped to tables in the same IBM Unica data source (that is, the same database). In defining the dimension table, you can specify the specific join conditions between the base and dimension tables.

1. Begin from the New Table Definition - Select the table type window.

   Note: You cannot map a dimension table from a Select process.

2. Select Dimension Table, then click Next.

3. Select the table you want to map from the Source Table list.

   The source fields in the table you select are mapped automatically to new table fields in the base dimension table you are creating. To change the default selections, select fields from the Source Table Fields list or the New Table Fields List, and use the Add, Remove, Up 1, and Down 1 buttons, until the table is mapped as required, then click Next.

   Note: You can click on the Field Name column in the New Table Fields section to automatically sort column names alphabetically in ascending (or descending) order.

4. (Optional) Change the name Campaign will use for the dimension table and its fields.
a. To change the table name, edit the name in the **IBM Unica Table Name** field.
b. To change a field name, select the mapping in the **New Table Fields** list, and edit the text in the **IBM Unica Field Name** field, then click **Next**.

5. Specify the dimension table’s key(s), and how the table will be joined to base record tables.

6. Select one or more keys in the **Key Field(s)** list.

7. Check **Key Field(s) are Normalized in This Table**, if this is the case.

8. Select the **Table Join Method**, then click **Next**.

**Note:** The option **Always use inner join** will always use an inner join between the base table and this dimension table, returning only audience IDs from the base table that appear in the dimension table. The **Always use outer join** option will always perform an outer join between the base table and this dimension table (which provides the best results if the dimension table is known not to contain at least one row for every audience ID in the base table). The default setting of **auto** uses an inner join in the Select and Segment processes and an outer join in output processes (Snapshot, Mail List, and Call List). This typically provides the desired behavior where values in the dimension table are required for selection criteria, but NULLs should be output for missing audience IDs for any dimension table fields that are output.

9. If base record tables exist, the **Specify Relationship to Base Tables** screen opens. Check the box to the left of any base record table that is related to the dimension table you are creating Specify the join fields, then click **Next**.

10. You can choose to pre-compute the distinct values and frequency counts for specific fields, or allow users to perform real-time profiling of data in the base record table.

11. Click **Finish**. You have created the dimension table.

**To map a general table to a database table**

You can map a new general table to an existing database table:

- When editing a flowchart through the **Admin** menu, as described in “Working with user tables while editing a flowchart” on page 29.
- Through the Campaign Settings page, as described in “Working with user tables from the Campaign Settings page” on page 30.

You map a new general table to export Campaign data for use by other applications.

1. Begin from the **New Table Definition - Select the table type** window.

2. Select **General Table**, then click **Next**.

3. Select **Map to Existing Table in Selected Database**, select the customer database name, then click **Next**.

4. Select the table you want to map from the **Source Table** list.
   
The source fields in the table you select are mapped automatically to new table fields in the general table you are creating. To change the automatic mappings, select fields from the **Source Table Fields** list or the **New Table Fields** List, and use the **Add, Remove, Up 1, an Down 1** buttons, until the table is mapped as required, then click **Next**.

5. (Optional) Change the name which Campaign will use for the general table and its fields.
To change the table name, edit the name in the **Unica Table Name** field.
To change a field name, select the mapping in the **New Table Fields** list, and edit the text in the **Unica Field Name** field.

6. Click **Finish**
You have created the general table based on a database table.

**To map a general table to a file**

You can map a new base record table to a file:
- When editing a flowchart, through the Admin menu, as described in “Working with user tables while editing a flowchart” on page 29.
- Through the Campaign Settings page, as described in “Working with user tables from the Campaign Settings page” on page 30.

You map a new general table to export Campaign data for use by other applications.

1. Begin from the **New Table Definition - Select the table type** window.
2. Select **General Table**, then click **Next**.
3. Select **Map to Existing File**, then click **Next**.
4. To map a base record table to a fixed-width flat file:
   a. Keep the default **File Type** selection.
   b. Click **Browse** to select the **Source File**. Campaign will automatically populate the **Dictionary File** field with the same path and file name, except with the **.dct** extension. You can override this entry if necessary.
5. To map a base record table to a delimited file:
   a. Select **Delimited File** for the **File Type**.
   b. Check **First Row of Data Contains Field Names** if this is the case.
   c. Select the **Field Delimiter** used: **TAB**, **COMMA**, or **SPACE**.
   d. Select the **Qualifier** used to indicate how strings are delimited in the file:
      - **None**,
      - **Single Quote**, or **Double Quote**.
   e. Click **Browse** to select the **Source File**, then click **Next**. The **Specify the New Table's Fields** window opens.
6. Specify the fields to use in the new table. By default, all fields in the file are listed.
   If you are mapping a delimited file, the first 50 lines of the file will be sampled for field type and width. You can override the field type (Numeric or Text) and the width, which are automatically detected. For example, if the IDs in the first 50 lines are detected to be 2 characters wide, but you know that IDs later in the file consist of up to 5 characters, increase the value to 5.

   **Important:** If the width value is too small, an error may occur.

**Note:** When you export data to a fixed-width flat file on disk, you can override the preset field lengths by editing the data dictionary for that file.
You use the **Add**, **Remove**, **Up 1** and **Down 1** buttons to specify the **Source Table Fields** that are included in the new table and their order.
7. When finished, click **Next**.
   The **Specify table name and field information** window opens.
8. Accept the defaults, or edit the **Unica Table Name** field to change the name of the table as it will appear in Campaign; and change the **Unica** field names that are mapped to the source field names.

9. Click **Finish**. You have created the general table based on a file.

**Re-mapping user tables**

You can remap a user table at any time. You may want to do this to:

- Remove unnecessary fields to simplify working with a table.
- Add new fields that need to be available.
- Rename the table or its fields.
- Add an audience level.
- Or change profiling characteristics.

If you remove a field that has been referenced in a flowchart or change the name of the table or referenced fields, you will cause the flowchart to become unconfigured. You must then manually edit each process box where the table is used to correct references.

Remember that remapping a user table changes only the local table mapping for the current flowchart. To save the updated table mapping to the table catalog, you must save the table catalog. Once saved into the table catalog, any flowchart subsequently using (or importing that table catalog) will see the changes.

You can re-map a user table:

- When editing a flowchart, through the Admin menu, as described in “Working with user tables while editing a flowchart” on page 29.
- Through the Campaign Settings page, as described in “Working with user tables from the Campaign Settings page” on page 30.

To re-map a user table:

1. Begin from the **New Table Definition - Select the table type** window.
2. Select the table to re-map.
3. Click **Re-Map Table**.
4. You then repeat the steps involved in mapping the table:
   - “To map a base record table to an existing database table” on page 30
   - “Mapping a base record table to an existing file” on page 32
   - “To map a dimension table” on page 34
   - “To map a general table to a database table” on page 35
   - “To map a general table to a file” on page 36

**Profiling values and counts**

When mapping a user table, you can choose to pre-compute the distinct values and frequency counts for specific fields, or allow users to perform real-time profiling of data in the base record table. Profiling enables users to see a table’s values when editing a flowchart, without having to view raw data and allows them to easily select from valid values when building a query. Pre-computed profiles provide quick and efficient access to the distinct field values and counts without querying the database. Real-time profiling provides access to the most up-to-date data and may be helpful if your database updates frequently. If you pre-compute profiles, you can control how often profiles are regenerated.
Note: You can choose to both pre-compute profiles and allow users to dynamically profile in real-time, or you can choose to disable real-time profiling and force users to always use the pre-computed profiles. Enabling or disabling the Allow real-time profiling option applies to all table fields, not just the checked ones. If you disable real-time profiling and do not specify an alternate means for pre-generated profiles, users will not be able to view any values or counts for any fields in this table. If you disable real-time profiling and provide pre-computed profiles for one or more fields, users will be able to access the pre-computed profiles, which is for the entire table. Users will not be able to profile only the values for the input cell of a process. To provide the greatest flexibility, you should allow real-time profiling.

To configure profiling:
1. Check the fields for which you want Campaign to pre-compute distinct values and frequency counts.
   By default, Campaign stores the pre-computed profiles in the Campaign > partitions > partition[n] > profile category as data source_table name_field name.
2. If you have distinct values and counts stored in a separate database table that Campaign should use, click Configure Data Sources. Select Data pre-defined in a table, select the table name, the field containing the values, and the field containing the counts. Then click OK.
3. Check Allow real-time profiling to have Campaign update its records of values for the selected fields in real-time. This option allows users editing a flowchart to see the current values for these fields. However, it also requires a database query each time a user clicks Profile, which can potentially degrade performance.

To unmap a user table

You can unmap a user table at any time (unmapping a table does not delete the original underlying data or affect any other flowchart).

Important: Unmapping a user table causes any process in the current flowchart referencing that user table to become unconfigured.

You can unmap a user table:
• When editing a flowchart, through the Admin menu, as described in “Working with user tables while editing a flowchart” on page 29.
• Through the Campaign Settings page, as described in “Working with user tables from the Campaign Settings page” on page 30.
1. Begin from the New Table Definition - Select the table type window.
2. Select the table to unmap.
3. Click Unmap Table. You are prompted to confirm.
4. Click OK to unmap the table.

Important: You cannot reverse this process. To restore an unmapped table, you must map it as if for the first time, or import a stored table catalog that contains the mapped table definition. If you are uncertain about permanently unmapping a table, you can always save your current table mappings into a table catalog for later restoration if needed.
To create a new user table through an output process

From the output processes (Snapshot, Call List, and Mail List) in the Export drop-down list, you can create new user tables.

1. While editing a flowchart, open the output process from which you want to create the new user table.
2. In the Export to drop-down list, select New Mapped Table. The New Table Definition window opens.
3. Select Base Record Table, Dimension Table, or General Table. Typically in this process, you would export the data to a new base table in an existing flat file or database. If you need to read the exported data back into Campaign, you must export it as a base table.
4. Click Next.
5. Select Create New File or Create New Table in Selected Database.
6. If you select to create a new database table:
   a. Select the database in which to create the table.
   b. Click Next.
   c. Select the Source Table Fields to export to the new table or file. You can select from Campaign Generated Fields, the audience-level identifier, and fields from the input cell. Use the Add, Remove, Up, and Down buttons to define fields in the New Table Fields list.
   d. Click Next.
   e. Specify a Database Table Name and Unica Table Name for the new table.
   f. Optionally, select the new table fields and modify the Unica Field Name.
   g. Click Next.
   h. Select the Audience Level for the new table and specify the audience level field in the new table.
   i. Click Next.
   j. Optionally, select additional audience levels for the new table by clicking Add.
   k. Click Next.
   l. Define profiling for the new table. For more information, see “Profiling values and counts” on page 37.
   m. Click Finish.
7. If you select to create a new file:
   a. Click Next.
   b. Select Fixed-Width Flat File or Delimited File, then specify the Settings fields appropriately.
   c. Click Next.
   d. Select the Source Table Fields to export to the new table or file. You can select from Campaign Generated Fields, the audience-level identifier, and fields from the input cell. Use the Add, Remove, Up, and Down buttons to define fields in the New Table Fields list.
   e. Click Next.
   f. Select the Audience Level for the new table and specify the audience level field in the new table.
   g. Click Next.
   h. Optionally, select additional audience levels for the new table by clicking Add.
i. Click Next.

j. Define profiling for the new table. For more information, see “Profiling values and counts” on page 37.

k. Click Finish.

---

Working with data dictionaries

You can edit the data dictionary for an existing or newly created base or general table, or create a new data dictionary from an existing fixed-width flat file.

Note: The data dictionary must be stored on the Campaign server or be accessible from the server to be used for table mapping.

To open a data dictionary

Find the data dictionary you want, then open it using Notepad or any other text editor.

The file you see will look similar to the following example:

```
cellID, ASCII string, 32, 0, Unknown,
MBRSHP, ASCII string, 12, 0, Unknown,
MP, ASCII Numeric, 16, 0, Unknown,
GST_PROF, ASCII Numeric, 16, 0, Unknown,
ID, ASCII Numeric, 10, 0, Descriptive/Names,
Response, ASCII Numeric, 10, 0, Flag,
AcctAge, ASCII Numeric, 10, 0, Quantity,
acct_id, ASCII string, 15, 0, Unknown,
src_extract_dt, ASCII string, 50, 0, Unknown,
extract_typ_cd, ASCII string, 3, 0, Unknown,
```

You can change information as needed in the file, making sure that the data that will be stored in the associated table can use the parameters you are setting.

To apply changes to a data dictionary

You must save, close, and reopen the flowchart.

When to use a data dictionary

You use data dictionaries in Snapshot processes to ensure that any fixed-width output files you create adhere to a specific structure.

Data dictionary syntax

Each line in a data dictionary defines a field in fixed-width flat file, using the following syntax:

```
<Variable_name>, <"ASCII string" or "ASCII Numeric">, <Length_in_bytes>, <Decimal_point >, <Format>, <Comment>
```

Note: The `<Decimal_point >` value specifies the number of digits following the decimal point and is valid for ASCII Numeric fields only. For ASCII string fields, the value should always be 0.

For example, the line:
acct_id, ASCII string, 15, 0, Unknown,

means that a record in the file has a field called acct_id, which is a 15-byte string with no decimal point (as the field is a string) with an unknown format and empty comment string.

Note: The format and comment fields are not used by Campaign. Therefore, for the best results, use “Unknown” for the format value and to leave the Comment field blank.

To manually create a new data dictionary

This section describes how to create a new data dictionary manually. It may be easier to create a new data dictionary by starting with an existing data dictionary created by Campaign.
1. Create an empty .dat file (length = 0) and a corresponding .dct file.
2. In the .dct file, define fields in the format:
   
   <Variable_name>, <"ASCII string" or "ASCII Numeric">, <Length_in_bytes>, <Decimal_point>, <Format>, <Comment>

   Use Unknown for the format and leave the comment field blank, as in the following:
   
   acct_id, ASCII string, 15, 0, Unknown,
   hsehld_id, ASCII Numeric, 16, 0, Unknown,
   occptn_cd, ASCII string, 2, 0, Unknown,
   dob, ASCII string, 10, 0, Unknown,
   natural_lang, ASCII string, 2, 0, Unknown,
   commun_lang, ASCII string, 2, 0, Unknown,

3. You can now map a new table to a file using this data dictionary.

Working with table catalogs

This section contains the following information:
- “To access table catalogs”
- “To open a table catalog” on page 42
- “To create a table catalog” on page 42
- “To load a stored table catalog” on page 43
- “Deleting table catalogs” on page 43
- “To update pre-computed profiles for tables in a table catalog” on page 44
- “To define a data folder for a table catalog” on page 44

To access table catalogs
1. Select Settings > Campaign Settings.
   The Campaign Settings page appears.
2. Click Manage Table Mappings.
   The Table Mappings window appears.
3. In the Table Mappings window, select Show User Tables.

Note: You can also access table catalogs from the Options menu while editing a flowchart.
To open a table catalog

1. Follow the instructions in “To access table catalogs” on page 41.
2. Click Load. The previously stored catalogs are listed in the Items List.
3. Select the catalog to open and click Load Catalog.

To create a table catalog

You create a table catalog by saving the user tables that are in the current flowchart’s internal table catalog. Saving table catalogs with commonly defined table mappings makes it easy to share table mappings or restore table mappings.

1. Follow the instructions in “To access table catalogs” on page 41. Ensure that the user tables you want to save as a table catalog are mapped in Campaign.
2. In the Table Mappings window, select the user tables you want to save to the table catalog, and click Save.
3. In the Save Tables window, select the option to save all table mappings to the table catalog, or the option to save only the selected table mappings to the table catalog, then click OK.
   
   The Save Table Mappings to Catalog File window opens.
4. Enter details for the new table catalog, including the folder under which you want to save it, a name, security policy, notes, and whether you want to save this catalog with database authentication information.
5. Enter a name for the table catalog. If you enter .XML as the extension name, the table catalog will be stored in XML format rather than as a proprietary binary file.

   Note: The name must be unique within the folder; otherwise you will be prompted to overwrite the existing table catalog with the same name. The name cannot contain any periods, apostrophes, or single quotation marks, must begin with a letter and can only contain the letters A-Z, the numbers 0-9, and the underscore character (_).

6. (Optional) Add a description for the table catalog in the Note field.
7. (Optional) Check Save with Database Authentication Information.
   
   • If you leave Save with Database Authentication Information unchecked, anyone using this table catalog will need to provide a database login and password for any data sources referenced in the table catalog. These passwords may be already stored in their ASM user profile. If they do not already have a stored valid login and password, the user is prompted to provide them. This setting is the best practice for security purposes.
   
   • If you check Save with Database Authentication Information, the current authentication information (the login[s] and password[s] you are currently using to access these data source[s]) are saved with the table catalog and anyone with access permissions to this table catalog will automatically be connected to the data sources using the authentication stored in the table catalog. This means that users of this table catalog will not need to provide a login or password to access these data sources and will have all the privileges of the stored login for reading and writing to the data source. You may want to avoid this setting for security reasons.

8. Select a folder in which to save the table catalog using the Save Under drop-down list.

   You can organize table catalogs in folders. Select an existing folder from the Items List, or click the New Folder button to create a new folder.
If you do not select a specific folder, or choose None in the Save Under drop-down list, the current table catalog will be saved at the top level. The selected folder appears after the Save Under field.

9. Click Save.

The table catalog is saved as a .cat file if no extension was provided with the name and in the location you have selected. If you specified a file name with a .xml extension, the table catalog is saved in XML format.

**To load a stored table catalog**

You can load a table catalog that you previously saved for use in the current flowchart.

**Note:** If you choose the Load table mappings from stored table catalog (existing mappings are cleared) option, the mapped tables in that flowchart are lost; that is, they are replaced with the table mappings from the loaded catalog. If you choose Merge table mappings from stored table catalog (old mappings are overwritten), old table mappings not in the new table catalog to be loaded are preserved.

If you define the default.cat table catalog, each time you create a new flowchart it is loaded by default. However, if you set your browser to accept cookies and load a different table catalog, that catalog is loaded by default instead of default.cat. This is also true for stored dimension hierarchies.

1. Follow the instructions in “To access table catalogs” on page 41.
2. Click Load.

   The Load Tables window opens.

3. Choose the appropriate option to select whether, when the tables are loaded, you want to clear or to overwrite the existing mappings. By default, the option to clear existing mappings is selected.

4. Click OK.

   The Stored Table Catalogs window opens.

5. Select the name of the table catalog that you want to load.

   When you click on the name of a table catalog, its information appears in the Info box and the Load Catalog button is enabled.

6. Click Load Catalog.

   The selected catalog is loaded. You see the details of the table(s) in the new catalog displayed in the Table Mappings window.

**Deleting table catalogs**

You delete table catalogs from a flowchart page in Edit mode. This task is not available from the Manage Table Mappings link on the Campaign Settings page.

**Important:** You should remove table catalogs only using the Campaign interface. If you remove tables or otherwise change table catalogs directly in the file system, Campaign cannot guarantee data integrity in your system.

For details about removing stored table catalogs, see the Campaign User's Guide.
To update pre-computed profiles for tables in a table catalog

If the underlying marketing data has changed, and you are using Campaign to pre-compute profile information for table fields, you will need to update the table catalog by recomputing the record counts and any pre-computed values you have specified in your tables.

1. Follow the instructions in “To access table catalogs” on page 41.
2. To update record counts and values for a subset of user tables, select these tables in the list of tables. You can use Ctrl+click to select multiple tables.

To compute record counts and values for all user tables, you do not need to select any tables.
3. Click Compute.

The Recompute window opens.

If you have not selected one or more user tables, by default, the Recompute Record Counts and List of Distinct Values for All Tables option is selected.
If you have selected a subset of tables, the Recompute Record Counts and List of Distinct Values for Selected Tables option is selected. The option to compute All Tables is available.

Note: If you have not selected any tables for computing and want to enable the option to compute values for selected tables, click Cancel on the Recompute window. The window closes and you are returned to the Table Mappings window, where you can select the tables for which you want the record counts and values to be computed.

4. When you are satisfied with your selection, click OK.

When the computations are complete, you return to the Table Mappings window.

To define a data folder for a table catalog

When you create a table catalog, you can also specify one or more data folders associated with that table catalog. In output processes such as Snapshot, these named folders appear in the file location selection dialog as pre-defined folder locations.

1. In a flowchart in Edit mode, click the Admin icon and select Tables.
2. In the Table Mappings window, select the mapped user tables that you want to save to a catalog. Click Save.
3. In the Save Table Mappings to Catalog File window, click in the Unica Data Folders section to add an item.
4. Enter a name and folder location for the data folder you are adding, relative to the current partition’s home directory. For example, if you are working in partition1, the folder location you specify is relative to the partitions/partition1 folder.
5. Click Save.

After you have saved the table catalog with its associated data folder(s), when you reload the catalog in a flowchart containing output processes such as Snapshot, these folders appear as options in the file location selection dialog.

For example, if you add a Unica Data Folder named MyFolder with the Folder Location temp, in a Snapshot process configuration dialog, File in MyFolder
appears in the Export to drop-down list. When you select File in MyFolder, the File Name field in the Specify Output File window is automatically populated with the relative path temp/.
Chapter 4. Customizing campaigns

You can customize your campaigns by using custom campaign attributes, initiatives, and products.

Custom campaign attributes

Note: If your Campaign installation is integrated with Marketing Operations, you must use Marketing Operations to create custom campaign attributes. For details, see the Marketing Operations documentation.

You can customize campaigns by adding custom campaign attributes to store metadata about each campaign.

Custom attributes can help you further define and categorize your campaigns. For example, you might define a custom campaign attribute Department to store the name of the department in your organization that is sponsoring the campaign. The custom attributes you define appear on the Summary tab for each campaign.

Custom campaign attributes apply to all campaigns in your system. If you add a custom campaign attribute when there are existing campaigns, the value of the attribute is NULL for these campaigns. You can later edit these campaigns to supply a value for the custom attribute.

Note: Names of custom attributes must be unique across campaign, offer, and cell custom attributes.

Custom cell attributes

Note: If your Campaign installation is integrated with Marketing Operations, you must use Marketing Operations to create custom cell attributes. For details, see the Marketing Operations documentation.

You can create custom attributes to store meta-data about the cells you create in a campaign. For example, you might define a custom cell attribute Audience Type to store possible values such as Cross-sell, Up-sell, Defection, or Loyalty.

Custom cell attributes are the same across all campaigns. Users enter values for custom cell attributes in the Target Cell Spreadsheet of a campaign. For example, if you created the custom cell attribute Audience Type as described above, users would see Audience Type as an available field when editing a row in the Target Cell spreadsheet.

Output processes in flowcharts can also generate output values for custom cell attributes as Campaign Generated Fields (UCGFs). Users can then view reports based on the values of the cell attributes, if the reports are customized to support this. For more information, see the Campaign User’s Guide.
Custom offer attributes

Campaign is delivered with a standard set of offer attributes for use in offer templates. You can create custom offer attributes to store additional offer metadata for definition, output, or analysis.

For example, you might define a custom offer attribute Interest Rate to store the value of the interest rate being marketed with mortgage offers.

When defining offer templates, you can choose which standard and custom offer attributes will be visible for a particular type of offer. Users then provide values for those attributes when creating and/or using offers.

You can use a custom attribute in an offer template in one of three ways:

- As a static attribute
- As a hidden static attribute
- As a parameterized attribute

What is a static attribute?

A static attribute is an offer field whose value is set once and does not change when the offer is used.

When you create an offer template, you supply values for all static attributes. When a user creates an offer based on that template, the values you entered are used by default; the user can override these default values as needed. However, users cannot override values for static attributes when using the offer in a flowchart process.

There are static attributes that are automatically included in all offer templates.

What is a hidden static attribute?

A hidden static attribute is an offer field that is not displayed to users when they create offers based on this template. For example, a hidden static attribute could be the cost to your organization of administering an offer.

Users creating offers cannot edit (or see) the value of hidden static attributes. However, you can track and generate reports on the values of hidden static attributes in the same way as you could other offer attributes.

When you are creating an offer template, the value you enter for a hidden static attribute applies to all offers based on the template.

What is a parameterized attribute?

A parameterized attribute is a field that users can change for every instance in which the offer is associated with a cell in a flowchart.

When you create an offer template, you supply a default value for the parameterized attribute. Then, when users create offers based on this template, they can accept or change the default value you entered. Finally, when the offer containing the parameterized attribute is associated with a cell in a flowchart, the user can accept or change the default value entered for the offer.
Select box attributes and offer templates

You can add attributes of the type **Select Box - String** to an offer template. When you created the custom attribute, if you indicated that users can add values to the list of valid selections by checking **Allow addition of list items from within edit forms**, then a user can add or delete list items when creating an offer based on this template.

Note: When users make changes to attribute list items as they create offers or edit offer templates, these changes are saved back to the custom attribute definition and reflected in any offer templates using the attribute. The updated list items are reflected when offers are created based on templates using the custom attribute, or when the custom attribute is used in any new offer template.

Working with custom attributes

The following topics explain how to work with custom attributes that can be used in campaigns, offer templates and offers, or cells on a Target Cell Spreadsheet:
- “To add a custom attribute”
- “To modify a custom attribute” on page 50
- “Using offer custom attributes in offer templates” on page 61
- “Adding list values to the Channel attribute” on page 61

To add a custom attribute

The steps for adding a custom campaign, offer, or cell attribute are the same. You specify the type of custom attribute during the creation process.

Note: You must have permissions to add custom campaign, offer, and cell attributes. For more information, see the Marketing Platform Administrator’s Guide.
1. Select **Settings > Campaign Settings**.
   The Campaign Settings page opens, presenting links for various administration tasks.
2. In the Templates and Customizations section, click **Custom Attribute Definitions**.
   The Custom Attribute Definitions window opens. The standard offer attributes and any previously created custom attributes are displayed.
3. At the top of the window, click **Add**; or at the bottom of the window, click **Add a Custom Attribute**.
   The Add Attributes Details window opens.
4. Enter data for the custom attribute as follows:
   a. Enter an **Attribute Display Name**, as you want the attribute label to appear to users. There are no special restrictions on custom attribute display names.
   b. Enter an **Internal Name**. You cannot have spaces in the internal name.
      The **Internal Name** is the name you use to reference this custom attribute when writing a Unica expression (for example, a query or custom macro). It is a best practice to use the same name as the display name without any spaces (for example, “Interest Rate” would have an internal name of “InterestRate”).

   **Important:** Custom attribute internal names must be globally unique and are case-insensitive. They have specific character restrictions and must start...
with an alphabetic character. For details, see Appendix B, “Special characters in Campaign object names,” on page 317.

c. From the Attribute Of drop-down list, select Campaign, Offer, or Cell.

d. Optionally, enter a Description.

e. From the Form Element Type list, select the type of data to be stored in the attribute field for offers or cells.

Important: After you add the custom attribute, you cannot change its data type.

f. Depending on your selection, you may need to enter one of the following:
   - **Maximum String Length**, if you selected Select Box - String or Text Field - String. This specifies the maximum number of characters that will be stored for any value of this custom attribute.
   - **Decimal Places**, if you selected Text Field - Numeric or Text Field - Currency. This specifies the number of decimal places to the right of the decimal point that are displayed.

Important: If you select Text Field - Currency, be aware that the currency value reflects the number of decimal places customarily used in the local currency. Therefore, if you specify a number of decimal places less than the number commonly used, the currency value will be truncated.

g. If you selected Select Box - String as the Form Element Type:
   - Optionally check **Allow addition of list items from within edit forms** to enable any user to add new unique values to the attribute drop-down list when creating offers using the template containing the attribute.
     - If any user adds a new value to the custom attribute, the value is subsequently displayed for all users.
   - Enter possible selections for the field by entering values in the New or Selected Item field and clicking Accept. Values are presented to users in alphabetical order. You can delete values from the list by selecting one or more in the Source list of available values and clicking Remove.

5. Click **Save Changes**.

To modify a custom attribute

You modify campaign, offer, and cell custom attributes in the same way.

**Note:** You must have permissions to modify offer and cell custom attributes. For more information, see the Marketing Platform Administrator’s Guide.

1. Select **Settings > Campaign Settings**.
   - The Campaign Settings page opens, presenting links for various administration tasks.

2. In the **Templates and Customizations** section, click **Custom Attribute Definitions**.
   - The Custom Attribute Definitions window opens. The default custom offer attributes and any previously created custom attributes are listed.

3. Click the name of the custom attribute you want to modify.
   - The Attributes Details window opens.

4. Modify data for the custom attribute as follows:
a. If you are modifying a custom attribute that you created, you can edit the **Attribute Display Name**. If you are modifying one of the standard custom attributes, you cannot edit this field.

b. If you are modifying a custom attribute that you created, you can edit the **Internal Name**. However, be aware that any uses of the internal name by existing flowcharts will cause an error, and you will receive a warning when you save the attribute. If you are modifying one of the default custom attributes, you cannot edit this field.

**Important:** Custom attribute internal names must be globally unique and are case-insensitive. They have specific character restrictions and must start with an alphabetic character. For details, see Appendix B, “Special characters in Campaign object names,” on page 317.

c. Optionally, modify the **Description**.

d. If the attribute is a Select Box - String or Text Field - String field, you can modify the **Maximum String Length**. This specifies the maximum number of characters that will be stored for any value of this custom attribute.

**Important:** If you decrease the **Maximum String Length** of a String field when modifying an attribute, you receive a warning that existing data may be truncated. Decreasing the length of an existing custom attribute will truncate any data values longer than the new length, which can adversely affect response tracking if the field is used for matching purposes.

e. If the attribute is a Text Field - Numeric or Text Field - Currency, you can modify the **Decimal Places**. This specifies the number of decimal places to the right of the decimal point that are displayed. For example, for currency, you may want to specify a decimal place value of two to show cents.

**Important:** If you decrease the **Decimal Places** number when modifying an attribute, if the attribute is used by offers or cells, the value for the attribute for those offers or cells as displayed through the web-based GUI is truncated to the new number of decimal places allowed. However, the value with the original number of decimal places is retained in the database.

f. If the attribute is a Select Box - String, you can:

- Change the setting for **Allow addition of list items from within edit forms**.
- Modify list items.

**Note:** You can only add or remove list items if the attribute was originally created with the Allow addition of list items from within edit forms option selected.

- Add list items by entering values in the **New or Selected Item** field and clicking **Accept**.
- Remove list items by selecting one or more items in the **Source list of available values** and clicking **Remove**.
- Edit an existing list item by selecting it in the **Source list of available values**. The item displays in the New or Selected Item field, where you can edit it and then click **Accept**.

5. When you have finished making your modifications, click **Save Changes**.
Custom initiatives

Campaign is delivered with a built-in attribute called Initiative. The Initiative attribute is a drop-down list on the campaign Summary tab. Initially, there are no values in the drop-down list; as an administrator, you define the initiatives to select from.

To add an initiative

You can add initiatives that users can select from the Initiative drop-down list in the campaign Summary tab. You add initiatives directly in the database table UA_Initiatives.

1. Access the Campaign system table database using your database management system.
2. In the database table UA_Initiatives, add values in the InitiativeName column. Each value can be a maximum of 255 characters.
3. Save the changes to the UA_Initiatives table.

Custom products

Users can associate an offer with one or more products. Product IDs are stored in the UA_Product table in the Campaign system table database. Initially, there are no records in this table. As an administrator, you can populate this table.

To add a product

You can add products that users can associate with offers. You add products directly in the database table UA_Products.

1. Access the Campaign system table database using your database management system.
2. Locate the UA_Product table.
   The table is delivered with two columns:
   • ProductID (bigint, length 8)
   • UserDefinedFields (int, length 4)
3. Optionally, modify the table to include additional columns. You may also delete the UserDefinedFields column.
4. Populate the table as necessary to include products that can be associated with offers.
5. Save the changes to the UA_Product table.
Chapter 5. Offer template administration

Before proceeding with offer management administration, you must understand the following:

- “What is an offer?”
- “What is an offer template?”
- “Offer templates and security” on page 54
- “Why use offer templates?” on page 54
- “Custom offer attributes” on page 48

What is an offer?

An offer is the specific marketing communication that you send to particular groups of people, using one or more channels. An offer can be simple or complex, and typically contains a creative piece, a cost, a channel, and an expiration date.

For example, a simple offer from an online retailer could consist of free shipping on all online purchases made in the month of April. A more complex offer could consist of a credit card from a financial institution, with a personalized combination of artwork, introductory rate, and expiration date that varied based on the recipient’s credit rating and region.

In Campaign, offers are:

- Based on the offer templates that you administer.
- Used in campaigns, where they are associated with target cells.

Associated offers are then delivered to customers identified in these target cells.

You can also group offers into lists, and assign offer lists to target cells.

Note: Offer names and offer list names have specific character restrictions. For details, see Appendix B, “Special characters in Campaign object names,” on page 317.

What is an offer template?

An offer template defines the structure of a particular type of offer. Users create offers by basing them on the offer templates you create.

Important: Offer templates are required. Users cannot create an offer without basing it on a template.

You can create as many offer templates as appropriate to manage the different types of offers within your business. As part of defining an offer template, you specify the relevant offer attributes and how they will be used.

Note: There are no specific restrictions on offer template names.
Offer templates and security

The security policy you set for an offer template determines which users will be able to use the offer template.

The security policy of the offer template is independent of the security policy applied to the offers created by using this offer template; that is, the security policy is not propagated to offers based on the template.

When users create new offers, the security policy of the offer is based on the folder in which it resides. If the folder is created in the top-level offers folder, the user can select other valid security policies for that offer.

To work with offer templates, which includes tasks such as adding, editing, or retiring offer templates, you must have the appropriate permissions, which includes the view permission for offer templates. For example, to add offer templates, you must be granted both the Add Offer Templates and View Offer Templates permissions.

For more information about Campaign security, see the Marketing Platform Administrator’s Guide.

Why use offer templates?

Offer templates provide you and your Campaign users with the following benefits:

• By creating offer templates, you simplify offer creation for your users because only relevant offer attributes for a particular type of offer are shown.
• By providing default values for offer attributes, you speed up the offer creation process.
• By specifying which offer attributes are parameterized in an offer template, you control when new offers are created and when an offer version can be used instead.
• By using custom attributes to capture specific data (for example, the discount percentage or bonus points associated with the offer), you enable better reporting and analysis of your campaigns.

Planning offer templates and offers

Planning offers includes considering which template to use, which attributes are parameterized, whether you will use holdout control groups for cells assigned this offer, and other considerations.

Offers can vary in the following ways:

• Different parameterized offer fields, including valid and expiry dates;
• Different offer codes (number of codes, length, format, custom code generator);
• Custom attributes (which are exposed for a specific type of offer; for example, credit card offers have initial APR% and go-to rates; mortgage offers have payment frequency and term).

As a best practice, keep parameterized values in offers to a minimum. Most offer attributes should not be parameterized. You should create parameters only for those attributes that will not change the “essence” of an offer, such as effective and expiration dates.
Carefully consider the design of your offers and offer templates, as this can significantly affect how you can analyze and report on campaign details.

For information on working with offers, see the Campaign User’s Guide.

**Working with offer attributes**

This section contains the following topics:
- “To add a custom attribute” on page 49
- “To modify a custom attribute” on page 50
- “Standard offer attributes” on page 57

**To add a custom attribute**

The steps for adding a custom campaign, offer, or cell attribute are the same. You specify the type of custom attribute during the creation process.

**Note:** You must have permissions to add custom campaign, offer, and cell attributes. For more information, see the Marketing Platform Administrator’s Guide.

1. Select **Settings > Campaign Settings**.
   The Campaign Settings page opens, presenting links for various administration tasks.

2. In the Templates and Customizations section, click **Custom Attribute Definitions**.
   The Custom Attribute Definitions window opens. The standard offer attributes and any previously created custom attributes are displayed.

3. At the top of the window, click **Add**; or at the bottom of the window, click **Add a Custom Attribute**.
   The Add Attributes Details window opens.

4. Enter data for the custom attribute as follows:
   a. Enter an **Attribute Display Name**, as you want the attribute label to appear to users. There are no special restrictions on custom attribute display names.
   b. Enter an **Internal Name**. You cannot have spaces in the internal name.
      The **Internal Name** is the name you use to reference this custom attribute when writing a Unica expression (for example, a query or custom macro). It is a best practice to use the same name as the display name without any spaces (for example, “Interest Rate” would have an internal name of “InterestRate”).
      **Important:** Custom attribute internal names must be globally unique and are case-insensitive. They have specific character restrictions and must start with an alphabetic character. For details, see Appendix B, “Special characters in Campaign object names,” on page 317.
   c. From the **Attribute Of** drop-down list, select **Campaign**, **Offer**, or **Cell**.
   d. Optionally, enter a **Description**.
   e. From the **Form Element Type** list, select the type of data to be stored in the attribute field for offers or cells.
      **Important:** After you add the custom attribute, you cannot change its data type.
   f. Depending on your selection, you may need to enter one of the following:
• **Maximum String Length**, if you selected **Select Box - String** or **Text Field - String**. This specifies the maximum number of characters that will be stored for any value of this custom attribute.

• **Decimal Places**, if you selected **Text Field - Numeric** or **Text Field - Currency**. This specifies the number of decimal places to the right of the decimal point that are displayed.

**Important**: If you select **Text Field - Currency**, be aware that the currency value reflects the number of decimal places customarily used in the local currency. Therefore, if you specify a number of decimal places less than the number commonly used, the currency value will be truncated.

g. If you selected **Select Box - String** as the Form Element Type:

• Optionally check **Allow addition of list items from within edit forms** to enable any user to add new unique values to the attribute drop-down list when creating offers using the template containing the attribute.

  If any user adds a new value to the custom attribute, the value is subsequently displayed for all users.

• Enter possible selections for the field by entering values in the **New or Selected Item** field and clicking **Accept**. Values are presented to users in alphabetical order. You can delete values from the list by selecting one or more in the Source list of available values and clicking **Remove**.

5. Click **Save Changes**.

**To modify a custom attribute**

You modify campaign, offer, and cell custom attributes in the same way.

**Note**: You must have permissions to modify offer and cell custom attributes. For more information, see the *Marketing Platform Administrator’s Guide*.

1. Select **Settings > Campaign Settings**.

   The Campaign Settings page opens, presenting links for various administration tasks.

2. In the **Templates and Customizations** section, click **Custom Attribute Definitions**.

   The Custom Attribute Definitions window opens. The default custom offer attributes and any previously created custom attributes are listed.

3. Click the name of the custom attribute you want to modify.

   The Attributes Details window opens.

4. Modify data for the custom attribute as follows:

   a. If you are modifying a custom attribute that you created, you can edit the **Attribute Display Name**. If you are modifying one of the standard custom attributes, you cannot edit this field.

   b. If you are modifying a custom attribute that you created, you can edit the **Internal Name**. However, be aware that any uses of the internal name by existing flowcharts will cause an error, and you will receive a warning when you save the attribute. If you are modifying one of the default custom attributes, you cannot edit this field.

**Important**: Custom attribute internal names must be globally unique and are case-insensitive. They have specific character restrictions and must start with an alphabetic character. For details, see Appendix B, “Special characters in Campaign object names,” on page 317.
c. Optionally, modify the **Description**.

d. If the attribute is a **Select Box - String** or **Text Field - String** field, you can modify the **Maximum String Length**. This specifies the maximum number of characters that will be stored for any value of this custom attribute.

**Important:** If you decrease the **Maximum String Length** of a String field when modifying an attribute, you receive a warning that existing data may be truncated. Decreasing the length of an existing custom attribute will truncate any data values longer than the new length, which can adversely affect response tracking if the field is used for matching purposes.

e. If the attribute is a **Text Field - Numeric** or **Text Field - Currency**, you can modify the **Decimal Places**. This specifies the number of decimal places to the right of the decimal point that are displayed. For example, for currency, you may want to specify a decimal place value of two to show cents.

**Important:** If you decrease the **Decimal Places** number when modifying an attribute, if the attribute is used by offers or cells, the value for the attribute for those offers or cells as displayed through the web-based GUI is truncated to the new number of decimal places allowed. However, the value with the original number of decimal places is retained in the database.

f. If the attribute is a **Select Box - String**, you can:
   - Change the setting for **Allow addition of list items from within edit forms**.
   - Modify list items.

**Note:** You can only add or remove list items if the attribute was originally created with the Allow addition of list items from within edit forms option selected.
   - Add list items by entering values in the **New or Selected Item** field and clicking **Accept**.
   - Remove list items by selecting one or more items in the **Source list of available values** and clicking **Remove**.
   - Edit an existing list item by selecting it in the **Source list of available values**. The item displays in the New or Selected Item field, where you can edit it and then click **Accept**.

5. When you have finished making your modifications, click **Save Changes**.

**Standard offer attributes**

The following table describes the standard offer attributes that are delivered with **Campaign**.

<table>
<thead>
<tr>
<th>Attribute Display Name</th>
<th>Attribute Internal Name</th>
<th>Form Element Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average Response Revenue</td>
<td>AverageResponseRevenue</td>

<td>Text Field - Date</td>
</tr>
</tbody>
</table>
Working with offer templates

Every offer is based on an offer template. Therefore, administrators must create offer templates before users can create offers.

You can make limited modifications to a template that has offers based on it (you can change the basic options and default values of attributes). To make other changes, you should retire the original offer template and replace it by creating a new one with the desired changes.

Before you start working with offer templates, you should create any custom offer attributes you might need. For example, you could create a drop-down list consisting of several choices, which users will be able to select from when creating offers.

Note: Working with offer templates requires the appropriate permissions. For example, to add offer templates, you must have both the Add Offer Templates and View Offer Templates permissions. For more information, see Chapter 2, “Managing security in IBM Unica Campaign,” on page 3.

To create an offer template

1. Select Settings > Campaign Settings.
   The Campaign Settings page opens, presenting links for various administration tasks.
2. In the Templates and Customizations section, click Offer Template Definitions.
   The Offer Template Definitions window opens.
3. At the bottom of the list of offer templates, click Add....
   The New Offer Template Step 1 of 3: Metadata window opens.
4. Enter offer template metadata as follows:
   a. Enter data for the basic options: Template Name, Security Policy, Description, Suggested Uses, and Template Icon.
   b. To use this offer template with Interact, select Allow offers created from this template to be used in real-time interactions.
   c. Accept the defaults, or modify data for the offer and treatment code formats and generators: Offer Code Format, Offer Code Generator, Treatment Code Format, and Treatment Code Generator.

   Important: You cannot use the space character in an offer code format.

   If you leave the Treatment Code Generator field empty, the default treatment code generator is used.
5. Click Next »».
   The New Offer Template Step 2 of 3: Offer Attributes window opens.
6. Add standard and custom attributes to the offer template as needed. Use the arrow buttons (<< and >>) to move attributes into and out of the attribute list for the offer template, and to change the order and type (static, hidden, or parameterized) of included attributes.

   **Note:** For an offer to be available in a flowchart, it must have at least one standard or custom attribute.

7. Click Next >>.
   
The New Offer Template Step 3 of 3: Default Values window opens.

8. For attributes you have added to the offer template, supply a default value that is used when users create offers using this template. When creating offers, users can change the default value of static and parameterized attributes, but cannot change the value you entered for hidden static attributes in the offer template.

9. For parameterized attributes with values supplied in a drop-down list, you can also add list items here, as you create the offer template. You can remove any new list items you add here, but cannot remove any list items that existed previously. Any additions to the list items made here are saved back to the offer custom attribute.

   **Important:** If you have added the Offer Valid/Expiration Dates attribute to the template as a parameterized attribute, on this screen you are presented with a Flowchart run date option. If you select this option instead of entering a default Offer Valid date, Campaign uses the date on which the process using offer runs, not the run date of the entire flowchart.

10. If you selected **Allow offers created from this template to be used in real-time interactions**, enter an Interaction Point ID and an Interaction Point Name.

    You can enter any integer for the Interaction Point ID default value, and any string for Interaction Point Name. The values are automatically populated with the correct data by the runtime environment, however, the design environment requires a default value.

11. Click Finish.

   You have created the offer template. It can now be used for creating offers.

**To modify an offer template**

If an offer exists that is based on the template, you cannot modify template data about offer codes, or the offer custom attributes. You can modify only the basic options and the default values of attributes. Therefore, to make other changes to an offer template, you should retire the original offer template and replace it by creating a new one with the desired changes.

1. Select Settings > Campaign Settings.

   The Campaign Settings page opens, presenting links for various administration tasks.

2. In the Templates and Customizations section, click Offer Template Definitions.

   The Offer Template Definitions window opens.

3. Click the name of the offer template to modify.

   The New Offer Template Step 1 of 3: Metadata window opens.
If the offer template is currently used by an offer, you can only edit the basic options. If not, you can also edit the offer and treatment code data.

4. Click Next >>.
   The New Offer Template Step 2 of 3: Offer Attributes window opens.
5. Modify attribute settings as needed.

   **Note:** If the offer template is currently used by an offer, you cannot change settings for offer attributes. If the template is not being used, you can modify the attributes in the offer template as needed. Use the arrow buttons (<< and >>) to move attributes into and out of the attribute list for the offer template, and to change the order and type (static, hidden, or parameterized) of included attributes.
6. Click Next >>.
   The New Offer Template Step 3 of 3: Default Values window opens.
7. For attributes in the offer template, supply a default value.
   When creating offers, users can change the default value of static and parameterized attributes. However, users cannot change the value you enter for hidden static attributes.

   **Important:** If you have added the Offer Valid/Expiration Dates attribute to the template as a parameterized attribute, on this screen you are presented with a radio box Flowchart run date. If you select this option instead of entering a default default Offer Valid date, Campaign uses the date the process that uses the offer runs, not the entire flowchart.
8. Click Finish.

You have modified the offer template.

**To reorder offer templates**

The order of offer templates you define is the order templates are presented to users when they create a new offer. By default, offer templates are listed in the order in which you created them. However, users see only the specific offer templates allowed by the security policy of the offer template and the roles of the user; therefore, the user may not see all offer templates. However, the order of the ones they do see is the order you specify.

1. Select **Settings > Campaign Settings**.
   The Campaign Settings page opens, presenting links for various administration tasks.
2. In the Templates and Customizations section, click **Offer Template Definitions**.
   The Offer Template Definitions window opens.
3. At the top or bottom of the list of offer templates, click **Reorder...**.
   The Reorder Offer Templates window opens, listing offer templates in the current order.
4. To change the order of offer templates, select one template at a time and click the up or down icons to move that templates location in the list.
5. When the offer templates are in the desired order, click **Save Changes**.
To retire an offer template

You retire an offer template when you no longer want users to be able to create new offers based on a template. Previously created offers based on the template you are retiring are not affected.

Note: After you retire an offer template, you cannot un-retire it. You would have to create a new offer template with the same characteristics.

1. Select Settings > Campaign Settings.
   The Campaign Settings page opens, presenting links for various administration tasks.
2. In the Templates and Customizations section, click Offer Template Definitions.
   The Offer Template Definitions window opens.
3. To the right of the offer template you no longer want available, click Retire.
   You are prompted to confirm the retirement.
4. Click OK to retire the offer template, or Cancel to stop the operation.
   If you click OK, the offer template is retired, and its status is indicated on the screen.

Using offer custom attributes in offer templates

Once you have created a custom attribute, it can be added to an offer template. Any offer created using that template includes the custom attributes.

Adding list values to the Channel attribute

Campaign includes the Channel custom attribute for use in offer templates. The Channel attribute is intended to indicate the outbound communication channel for the offer, such as e-mail or phone.

As delivered, the Channel attribute, of type Select Box - String, does not include any available values. To make use of the Channel attribute, you must provide the values from which users can select by modifying the attribute.

You can also allow users to enter additional values for the field by checking Allow additional of list items from within edit forms.

Offer template references

This section contains reference information about properties you work with when creating or editing an offer template:
- “Template icons”
- “Default offer attributes” on page 63

Template icons

You select a template icon as part of the basic options when you create or modify an offer template. The template icon serves as a visual clue about the offer template when users create new offers. The following table lists and shows the available template icons:
Table 17. Offer template icons

<table>
<thead>
<tr>
<th>Icon Name</th>
<th>Icon</th>
</tr>
</thead>
<tbody>
<tr>
<td>offertemplate_default.gif</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>offertemplate_simplephone.gif</td>
<td></td>
</tr>
<tr>
<td>offertemplate_versions.gif</td>
<td></td>
</tr>
</tbody>
</table>
Default offer attributes

When you create an offer template, you can add template attributes as needed.

By default, the following static attributes are included in all offer templates:

- Name
- Description
- Offer Code
- Relevant Product(s)

You cannot remove these static attributes from a template.
Chapter 6. Audience level administration

As a Campaign administrator, you can perform the following tasks:

• Create the audience levels needed for your company’s campaigns.
• Create database tables in the Campaign system database to support the new audience levels.
• Map system tables to the supporting database tables for the new audience levels in the Campaign system database.
• Specify audience levels and associated database fields when mapping user tables.
• Create global suppression segments for one or more audience levels.

About audience levels

An audience level is a collection of identifiers that can be targeted by a campaign. For example, a set of campaigns could use the audience levels “Household,” “Prospect,” “Customer,” and “Account.” Each of these levels represents a certain view of the marketing data available for a campaign.

Audience levels are typically organized hierarchically. Using the examples above:

• Household is at the top of the hierarchy, and each household can contain multiple customers as well as one or more prospects.
• Customer is next in the hierarchy, and each customer can have multiple accounts.
• Account is at the bottom of the hierarchy.

Other, more complex examples of audience hierarchies exist in business-to-business environments, where audience levels may need to exist for businesses, companies, divisions, groups, individuals, accounts, and so on.

These audience levels may have different relationships with each other, for example one-to-one, many-to-one, or many-to-many. By defining audience levels, you allow these concepts to be represented within Campaign so that users can manage the relationships among these different audiences for targeting purposes. For example, although there might be multiple prospects per household, you might want to limit mailings to one prospect per household.

An audience level is composed of a fixed number of keys or database table fields, which together uniquely identify a member of that audience level.

For example, the audience level “Customer” might be identified by a single IndivID field or by a combination of a HouseholdID field and a MemberNum field.

For more details about audience levels, see the section on the Audience process in the Campaign User’s Guide.
Why different audience levels are needed in Campaign

Different audience levels enable flowchart designers to target and switch between specific identifiable groups in their campaigns, or to scope one audience level by another (for example, to target one individual per household).

For example, audience levels enable developers to do such things as:
- Select the customer with the highest account balance in each household.
- Select all accounts with a negative balance belonging to a particular set of customers.
- Select all households with at least one individual holding a checking account.

For more details about audience levels, see the section on the Audience process in the Campaign User’s Guide.

The default Customer audience level

Campaign is delivered with a single audience level called Customer. You can define additional audience levels as required for your user tables and campaign needs.

By default, the Campaign system database contains the tables needed to support the Customer audience level. After installing Campaign, you must map these tables.

Creating additional audience levels

If you require additional audience levels, you must create and map the equivalent set of system tables to support them as you did for the default Customer audience level.

You must define audience levels before you map user tables, so that you can specify audience levels during the user table mapping process. Base tables mapped at a specific audience level, when queried, will return IDs at that audience level.

About audience levels and system tables

Each audience level you create requires the following associated system tables:
- A contact history table
- A detailed contact history table
- A response history table
- A segment membership table

These system table entries are automatically created when you create the audience level. You must then:
- Create the physical database tables in the Campaign system table database.
- Map these system tables to the database tables.

Note: IBM recommends that you map the segment membership table only if you are using strategic segments with Campaign flowcharts or Optimize sessions in Optimize.
Default Customer audience level system tables

Campaign is delivered with system table ddl scripts to create the tables that support the default Customer audience level. After installing Campaign, you must map these system tables to tables in the Campaign system database as follows:

<table>
<thead>
<tr>
<th>Unica system table</th>
<th>Database Table Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customer Contact History</td>
<td>UA_ContactHistory</td>
</tr>
<tr>
<td>Customer Response History</td>
<td>UA_ResponseHistory</td>
</tr>
<tr>
<td>Customer Detailed Contact History Table</td>
<td>UA_DtlContactHist</td>
</tr>
<tr>
<td>Customer Segment Membership</td>
<td>UA_SegMembership</td>
</tr>
</tbody>
</table>

If these tables are mapped as listed above, then the sample reports provided with Campaign will work with a minimum number of changes.

The SQL statements used to create these tables and their related indices can be used as templates to create tables for other audience levels.

About audience levels and strategic segments

For each audience included in a flowchart or Optimize session that uses strategic segments, you map the segment membership system table to a physical table that defines segment members. For example, to use the default Customer audience in an optimization session that includes strategic segments, you must map the audience system table Customer Segment Membership to the UA_SegMembership segment database table. You populate the database table using the Create Seg process.

Note: Unica recommends that you map an audience's segment membership table only if you plan to use the audience in flowcharts or Optimize sessions that use strategic segments.

Using strategic segments in Campaign flowcharts or Optimize sessions is optional. If you map the segment membership table, each time you run the flowchart or Optimize session, Campaign or Optimize updates the table. This is unnecessary processing overhead if you are not using strategic segments.

Audience level unique identifiers

When you create a new audience level, you must specify at least one field to be used as the unique identifier for members of that audience level. To uniquely identify each member of the audience, you might need to use multiple fields. For example:
- Household could be identified by the field HHold_ID
- Customer could be identified by the fields HHold_ID and MemberNum.
- Prospect could be identified by the field Prospect_ID.
- Account could be identified by the field Acct_ID.

The field names (and in particular any unique identifier field names) in the new audience level must exactly match the field name(s) in the database table for mapping. This allows Campaign to automatically match the database fields to the appropriate system table fields when you create the audience level.
**Note:** Audience level field names have specific character restrictions. For details, see Appendix B, “Special characters in Campaign object names,” on page 317

**Required fields in audience-level-specific tables**

This section provides lists of the required fields in the system tables required for each audience level.

- “Required fields in the contact history table”
- “Required fields in the detailed contact history table”
- “Required fields in the response history table” on page 69
- “Required fields in the segment membership table” on page 69

**Required fields in the contact history table**

The contact history table for each audience level in the Campaign system database must minimally contain the following fields:

**Table 19. Required fields in the contact history table**

<table>
<thead>
<tr>
<th>Key</th>
<th>Column Name</th>
<th>Data Type</th>
<th>Length</th>
<th>Allow Nulls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Identifier for audience level</td>
<td>numeric or text</td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>Yes</td>
<td>CellID</td>
<td>bigint</td>
<td>8</td>
<td>No</td>
</tr>
<tr>
<td>Yes</td>
<td>PackageID</td>
<td>bigint</td>
<td>8</td>
<td>No</td>
</tr>
<tr>
<td>No</td>
<td>ContactDateTime</td>
<td>datetime</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>UpdateDateTime</td>
<td>datetime</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>ContactStatusID</td>
<td>bigint</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>DateID</td>
<td>bigint</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>TimeID</td>
<td>bigint</td>
<td>8</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Note:** Campaign is shipped with additional fields (ValueBefore and UsageBefore) in the UA_ContactHistory table for the Customer audience level to support the example reports. You can define your own “additionally tracked fields” for contact history and customize reports as needed.

**Required fields in the detailed contact history table**

The detailed contact history table for each audience level in the Campaign system database must minimally contain the following fields:

**Table 20. Required fields in the detailed contact history table**

<table>
<thead>
<tr>
<th>Key</th>
<th>Column Name</th>
<th>Data Type</th>
<th>Length</th>
<th>Allow Nulls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Identifier for audience level</td>
<td>numeric or text</td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>No</td>
<td>TreatmentInstID</td>
<td>bigint</td>

<td>No</td>
</tr>
<tr>
<td>No</td>
<td>ContactStatusID</td>
<td>bigint</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>ContactDateTime</td>
<td>datetime</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>UpdateDateTime</td>
<td>datetime</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>DateID</td>
<td>bigint</td>
<td>8</td>
<td>No</td>
</tr>
<tr>
<td>No</td>
<td>TimeID</td>
<td>bigint</td>
<td>8</td>
<td>No</td>
</tr>
</tbody>
</table>
Required fields in the response history table

The response history table for each audience level in the Campaign system database must minimally contain the following fields:

*Table 21. Required fields in the response history table*

<table>
<thead>
<tr>
<th>Key</th>
<th>Column Name</th>
<th>Data Type</th>
<th>Length</th>
<th>Allow Nulls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Identifier for audience level</td>
<td>numeric or text</td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>Yes</td>
<td>TreatmentInstID</td>
<td>bigint</td>
<td>8</td>
<td>No</td>
</tr>
<tr>
<td>Yes</td>
<td>ResponsePackID</td>
<td>bigint</td>
<td>8</td>
<td>No</td>
</tr>
<tr>
<td>No</td>
<td>ResponseDateTime</td>
<td>datetime</td>
<td>8</td>
<td>No</td>
</tr>
<tr>
<td>No</td>
<td>WithinDateRangeFlg</td>
<td>int</td>
<td>4</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>OrigContactedFlg</td>
<td>int</td>
<td>4</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>BestAttrib</td>
<td>int</td>
<td>4</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>FractionalAttrib</td>
<td>float</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>CustomAttrib</td>
<td>float</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>ResponseTypeID</td>
<td>bigint</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>DateID</td>
<td>bigint</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>TimeID</td>
<td>bigint</td>
<td>8</td>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>DirectResponse</td>
<td>int</td>
<td>4</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Each response history table you create for a new audience level should have a foreign key constraint on the UA_Treatment table’s TreatmentInstID field.

Required fields in the segment membership table

If you are using strategic segments in Campaign or Optimize, you must create the segment membership table for each audience level that you use with strategic segments. At a minimum, the table must contain the following fields.

*Table 22. Required fields in the segment membership table*

<table>
<thead>
<tr>
<th>Key</th>
<th>Column Name</th>
<th>Data Type</th>
<th>Length</th>
<th>Allow Nulls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>SegmentID</td>
<td>bigint</td>
<td>8</td>
<td>No</td>
</tr>
<tr>
<td>Yes</td>
<td>Identifier for audience level</td>
<td>numeric or text</td>
<td></td>
<td>No</td>
</tr>
</tbody>
</table>

About audience levels and user tables

This section contains the following information:
- “User tables with a single audience level”
- “User tables with multiple audience levels” on page 70

User tables with a single audience level

When you map a user table, you must specify at least one audience level to be the primary audience of that table. During this step, Campaign associates the field(s) you specified when creating the audience level with the identifier field(s) of the
same name in the user table. By doing this, you have specified that by default, when Campaign makes selections from this user table, IDs are returned from the primary audience level.

For example, if you create an audience level named Account with the field Acct_ID, and select this audience level as the primary audience when mapping the user table Accounts, you have associated the Acct_ID audience level field with the field in the user table that is the unique identifier (primary key) for the Accounts database table.

User tables with multiple audience levels

A user table can be associated with multiple audience levels, with one of the audience levels designated as the primary audience level, and the remaining audience levels as alternate audience levels.

Note: To enable flowchart designers to switch from one audience level to another or to scope one audience level by another, you must define at least one user table with all required audience levels. Campaign can then use this table to "translate" between one audience level and another as needed.

For example, a user table that contains data about customer accounts could have the following columns:

- Acct_ID
- Indiv_ID
- HHold_ID

In this table, the Acct_ID might be unique for each record. Because an individual could have multiple accounts, and a household could contain multiple individuals, multiple records could have the same values for the Indiv_ID and HHold_ID fields.

Assuming you have three audience levels, Account, Customer, and Household, when you map this user table, you could specify all three of these audience levels and associate them with the corresponding fields listed above in the user table. This enables flowchart designers to switch target audiences, or scope one audience level by another (for example, accounts per customer, customers per household, or accounts per household) when using this table.

Working with audience levels

This section contains the following information:
- "Workflow for setting up a new audience level"
- “Removing an audience level” on page 73

Workflow for setting up a new audience level

The following steps provide the workflow for setting up a new audience level. See each task for the specific procedures.

- “Task 1: Create the required database tables for each new audience level” on page 71
- “Task 2: Create the new audience levels in Campaign” on page 71
- “Task 3: Map the Unica system tables to the database tables” on page 72
- “Task 4: Map the user tables containing relevant data to the appropriate audience level(s)” on page 73
Task 1: Create the required database tables for each new audience level

You must create physical database tables in the Campaign system database to support each new audience level(s) you create. The required tables for each audience level are:

- A contact history table
- A detailed contact history table
- A response history table
- A segment membership table

Each required table has a set of required fields. You can create additional custom fields in your audience tables.

Note: You should create indices on the tables you create. For example, if you create the INDIV_ContactHistory table for a new Individual audience level, you could create an index as follows: `CREATE INDEX XIE1INDIV_ContactHistory ON INDIV_ContactHistory (IndivID)`.

To create the tables for other audience levels, you may want to use the SQL statements used to create the Campaign default audience level tables and their related indices as templates. For example, you could use UA_ContactHistory as a template for Acct_ContactHistory (for an audience level Account). To see the available SQL statements, look in the `/Campaign/ddl` directory for the script that creates system tables for your database management system.

Note: You have the flexibility to map multiple system tables for a new audience level to the same underlying physical database table (containing sufficient audience fields to represent all necessary audience levels), or you can create separate database tables for each audience level. IBM Unica consulting or your implementation partner can help you decide how to best implement contact and response history tables for your environment.

Task 2: Create the new audience levels in Campaign

1. Select Settings > Campaign Settings.
   The Campaign Settings page appears.
2. On the Campaign Settings page, under Data Source Operations, click Manage Audience Levels.
   The Audience Levels window opens, displaying existing audience levels.
3. Click Create New.
   The Create New Audience Level window opens.
4. Enter a unique Audience Level Name, which should reflect the group of identifiers at that audience level.
   Audience level names have no specific character restrictions.
5. In the Field List, enter a name and select the type (numeric or text) for each field that will be used to uniquely identify each member of the audience level.

Note: Audience level field names have specific character restrictions.
You must specify exactly the same names as the field names in the database tables for this audience level. Fields can only be mapped in Task 3: Map the Unica system tables to the database tables, if Campaign finds an exact match for the field names.

For example, if you are creating the new audience level “Household” and you specify one field for unique audience level identifier called “HouseholdID,” you must make sure the ID field in your audience level-specific database tables matches this exactly; in other words, that it is also named “HouseholdID.”

6. Click OK.

In the Audience Levels window, when you select the new audience level, you see the required tables listed as “Not Mapped.” You perform the mapping in “Task 3: Map the Unica system tables to the database tables.”

**Task 3: Map the Unica system tables to the database tables**

After creating the physical database tables for each new audience level and the audience levels in Campaign, you must map the Unica system tables to these database tables.

You can map user tables to your created audience levels without mapping the Unica system tables to database tables, but you will not be able to log contact and response history without mapping the Contact History, Detailed Contact History, and Response History tables.

IBM recommends that you map segment membership system tables to physical database tables only for audiences used in Campaign flowcharts or Optimize sessions that contain strategic segments. Using strategic segments in Campaign and Optimize is optional.

1. Select Settings > Campaign Settings.
   
   The Campaign Settings page appears.

2. On the Campaign Settings page, under Data Source Operations, click Manage Audience Levels.
   
   The Audience Levels window opens, displaying existing audience levels.

3. Select the audience level for which you are mapping database tables, and click History Tables.

4. On the Table Mappings window, select each Unica system table and click Map Table.

5. On the table mapping window, select the database table corresponding to the Unica system table for that audience level. The Source Table Fields list is populated with the fields from the database table you selected. The Required Fields list is populated with Selected Fields (from your source database table) and the corresponding Required Fields (from the Unica system table).

   **Important:** Fields can only be mapped if Campaign finds an exact match for the field names.

6. Click Next to specify mapping for any custom fields in your database tables.

7. Click Next to specify display names for custom fields. This option is not available for all tables.

8. Click Finish to complete the mapping. Repeat this procedure for each required Unica system table for the audience level.
Note: You can also perform this task from the Manage Table Mappings link on the Campaign Settings page.

**Task 4: Map the user tables containing relevant data to the appropriate audience level(s)**

When you map a user table, you must specify one primary audience level. You can also specify one or more alternate audience levels.

For each audience level, map to the user table containing the identifier for the entity at that audience level.

**Task 5: Save the mapped tables in a table catalog**

(Optional). Save your mapped tables in a table catalog so that you can reload the catalog without remapping individual tables.

**Removing an audience level**

**Important:** Do not remove an audience level that has been used within Campaign, as this will result in significant system problems, as described below.

When you remove an audience level, the Unica system tables are removed, but the underlying database tables remain.

Therefore, if you remove an audience level, any processes and flowcharts depending on that audience level (that is, that attempt to write to the audience level tables) will generate errors.

**Important:** Before removing an audience level, Unica recommends backing up the entire Campaign system so that you can recover the current system state if you encounter problems following the removal.

It is possible to restore a deleted audience level by creating a “new” audience level of the same name, with tables containing the same required fields, and remapping the audience level tables.

**To remove an audience level**

1. Select **Settings > Campaign Settings**.
   - The Campaign Settings page appears.
2. Under **Data Source Operations**, click **Manage Audience Levels**.
   - The Audience Levels window opens, displaying previously defined audience levels.
3. Select the audience level to remove.
4. Click **Remove**.
   - You are prompted to confirm the removal.
5. Click **OK**.

**About global suppressions and global suppression segments**

**Note:** Specifying and managing global suppression segments requires the “Manage Global Suppressions” permission in Campaign.
Use the global suppression feature to specify a list of IDs (in a single audience level) that are automatically excluded from all cells in flowcharts in Campaign.

You do this by creating this list of unique IDs as a strategic segment, then by specifying that segment as a global suppression segment for a particular audience level. Only one global suppression segment can be configured for each audience level.

If a global suppression segment has been configured for an audience level, all top-level Select, Extract, or Audience processes associated with that audience level automatically exclude the IDs in the global suppression segment from their output results, unless the global suppression is explicitly disabled for a specific flowchart. By default, flowcharts have global suppression enabled so that no action needs to be taken for any configured global suppression to be applied.

For details about disabling global suppressions, see the Campaign User’s Guide.

An exception to the default of global suppression being enabled is the flowchart containing the CreateSeg process that created the global strategic segment itself. In this case, the global suppression is always disabled (only for the audience level for which the global suppression segment is created).

Switching audiences with global suppressions

If you are switching from Audience 1 to Audience 2 in a flowchart, and have one global suppression defined for each of these audience levels, the global suppression segment for Audience 1 is applied to the input table, and the global suppression segment for Audience 2 is applied to the output table.

About creating global suppression segments

You create global suppression segments by performing the following tasks:

- “To create the global suppression segment in a flowchart”
- “To specify the segment as a global suppression segment” on page 75

To create the global suppression segment in a flowchart

Important: The best practice for creating or updating global suppression segments is to do this when no flowcharts at the same audience level are running (and thus potentially using the segment(s)). The consistency of suppression lists cannot be guaranteed if global suppression segments are created or updated while flowcharts are using them.

1. Create a strategic segment in a flowchart in the usual way, naming it in such a way that you can identify it easily for selection from a list. For details about creating strategic segments, see the Campaign User’s Guide.
2. In the CreateSeg process configuration dialog, on the Define Segments tab, click Edit...
3. In the Edit Segment window, in the Temp Table Data Source field, select one or more data sources.
   You should specify all data sources where the global strategic segment is commonly used. If the strategic segment is not persisted in a data source, then the suppression is done on the Campaign server using the binary file. If the CreateSeg process is unable to create the strategic segment or write the segment to any of the specified data sources, it will be unconfigured or fail when run.
Changes to the temp table data sources are made at the time you save the process configuration, not when the flowchart is saved or run.

4. Click OK.

On the Define Segments tab, you see that the data source you selected is displayed in the Temp Table DS column for the current segment.

**To specify the segment as a global suppression segment**

1. After creating the segment that you want to use as a global suppression segment, in Campaign, select Settings > Campaign Settings.

   The Campaign Settings page appears.

2. On the Campaign Settings page, click Manage Audience Levels.

3. In the Audience Levels window, select the audience level for which you are specifying a global suppression segment.

4. Click Global Suppressions...

   In the Global Suppression Segment window, the drop-down list displays the list of segments matching the current audience level.

5. Select the segment to use as the global suppression segment for the current audience level, then click OK.

6. Click Close.

The selected strategic segment is specified as the global suppression segment for the audience level.

On the Marketing Platform Configuration page, the global suppression segment, when defined, is displayed in audience level properties in the following path:

```
partitions > partition[n] > audienceLevels > audienceLevelN > globalSuppressionSegmentID.
```

**Updating global suppression segments**

You update global suppression segments in the same way as you would update strategic segments. For details about editing strategic segments, see the *Campaign User’s Guide*.

**Important:** The best practice for creating or updating global suppression segments is to do this when no flowcharts at the same audience level are running (and thus potentially using the segment(s)). The consistency of suppression lists cannot be guaranteed if global suppression segments are created or updated while flowcharts are using them.

**Deleting global suppression segments**

You delete global suppression segments in the same way as you would delete strategic segments. For details about deleting strategic segments, see the *Campaign User’s Guide*.

When the flowchart that created the global suppression segment is deleted, the segment is also deleted.

**Logging for global suppressions**

The following information relating to global suppressions is included in the flowchart log:
• The global suppressions segment name (and path) for processes in which it is applied
• The number of IDs before suppression
• The number of IDs after suppression
Chapter 7. Contact history administration

Before you begin working with contact history, you should read all audience level administration topics and set up required audience levels.

Contact history is stored in the Campaign system database in separate tables by audience level; you therefore need to set up audience levels prior to working with contact history.

In addition, you can find basic concepts about contact history, and information about setting up flowcharts to record contact history, in the Campaign User’s Guide.

Contact history concepts

This section contains the following information:

- “What is contact history?”
- “What is detailed contact history?” on page 78
- “What is contact status?” on page 78
- “About updating contact status” on page 78
- “How does contact history relate to audience levels?” on page 79
- “How does contact history relate to database and system tables?” on page 79
- “What is offer history?” on page 79
- “What is treatment history?” on page 79

What is contact history?

Contact history is the historical record of your direct marketing efforts or communications, including detailed information of whom was contacted, when, with what message or offer, and on what channel. Contact history typically includes both targets contacted through campaigns, as well as your hold-out controls whom do not receive a communication, but are measured for comparison purposes against the target group.

In Campaign, contact history includes the record of the exact version offer given to each ID, including the values of personalized offer attributes, providing a complete historical view of your marketing communications.

For example, a campaign may produce a list of targeted customers, output through a Call List or Mail List process. That list of customers is written to the contact history table for the example Customer audience level, UA_ContactHistory, in the Campaign system database.

Contact history is recorded and stored in the Campaign system database. There is a separate entry for a base contact history system table for each audience level you create. The base contact history stores the audience membership within each target and control cell used in your marketing campaigns, when all audience entities within the same cell receive exactly the same offer(s). Data from the base contact history table is used in conjunction with the UA_Treatment system table to resolve exactly who received which offers.
Note: If users turn off contact history logging in the Call List or Mail List process, contact history made in that process is not written to the database.

Contact history is written to the database for production runs only, not test runs.

**What is detailed contact history?**

Detailed contact history is populated only when data-driven offer personalization is used (where individuals in the same cell receive different offer versions: that is, offers with different values for personalized offer attributes). These details are written to the detailed contact history table (for example, \texttt{UA\_Dt1ContactHist}) for each audience level.

There is a separate entry for a detailed contact history system table for each audience level you create. The detailed contact history stores the exact treatment(s) each audience entity received.

Detailed contact history records one row per audience ID-offer version pair. For example, if an individual receives three different offer versions, three rows are written to detailed contact history for that individual, and the three treatments will appear in the \texttt{UA\_Treatment} table.

Note: If users turn off contact history logging in the Call List or Mail List process, detailed contact history made in that process is not written to the database.

Detailed contact history is written to the database for production runs only, not test runs.

**What is contact status?**

Contact status is the indicator of the type of contact made. Campaign users specify the contact status to use when configuring a Call List or Mail List process.

Note: Control cells automatically receive the contact status with a value of 2 in the Defaults column. By default, the Name of that row is Contact.

Campaign is delivered with a set of default contact status codes. As an administrator, you can add additional status codes.

**About updating contact status**

You use the Track process to update contact statuses, as well as other tracked fields in the contact history.

For example, a Mail List process may record customer contacts in the \texttt{UA\_ContactHistory} table. The contacts would have temporary contact status with a value in the \texttt{CountsAsContact} field of 0. The campaign manager then sends this list of contacts to a mail house. The mail house performs post-processing on the list, eliminating addresses that are no longer valid, and returns a list of customers who were actually contacted. A different flowchart then selects the customers from the returned list and uses the Track process to update the contact status to one with a \texttt{CountsAsContact} field of 1.

For information about using the Track process, see the *Campaign User's Guide*. 
How does contact history relate to audience levels?

Campaign can record and maintain a separate contact history and detailed contact history for each audience level you have defined. Each audience level should have its own related contact history and detailed contact history tables in the Campaign system database.

How does contact history relate to database and system tables?

Contact history tables, which must exist in the Campaign system database, store historical contacts for each audience level.

The Customer audience level is delivered as an example, and the history of contacts targeting customers can be stored in the UA_ContactHistory in the Campaign system database. Detailed history for the Customer audience level can be stored in the UA_DtlContactHist table.

If you create an additional audience level, you must create the contact history and detailed contact history tables and related indexes for it in the Campaign system database. You can use the tables for the example Customer audience level as templates.

After you create the tables in the Campaign system database for a new audience level, you must map the new tables for the audience level's contact history and detailed contact history.

What is offer history?

Offer history is the historical record of offers made through campaigns. It is part of the overall historical record of contacts made through your campaigns.

Offer history is stored across multiple tables in the Campaign system table database:
- UA_OfferHistory table
- UA_OfferHistAttrib table (for parameterized offer attributes),
- UA_OfferAttribute table (for static offer attributes)

For example, a typical flowchart results in a list of targeted customers, output through a Call List or Mail List process. A record of the offer(s) made in that flowchart are written to the UA_OfferHistory table offer history.

Note: If users turn off contact history logging in the Call List or Mail List process, offer history made in that process is not written to the database.

Offer history is written to the database for production runs only, not test runs.

Offer history is not stored in separate tables by audience level; all offer history is stored across the same set of system tables.

What is treatment history?

Treatment history is the record of treatments generated through campaigns, including both target and control treatments. A treatment is a unique combination of a cell, an offer, and time (a specific flowchart run). If you run the same flowchart multiple times, a new treatment is generated each time.
Treatment history is stored in the UA_Treatment table in the Campaign system table database, and is used together with contact history to form a complete historical record of offers sent to IDs in cells, and the specific details of each sent offer’s attributes.

Cell membership is recorded in the UA_ContactHistory table for the appropriate audience level and the treatment(s) given to each cell are recorded in the UA_Treatment table. This is a highly compressed and efficient way to store complete historical information. For example, if all 10,000 people in a cell receive the same three offers, rather than writing $3 \times 10,000 = 30,000$ records to contact history, 10,000 rows are written to contact history recording the individuals within the cell, and 3 rows are written to the UA_Treatment table representing the treatments.

**Note:** If users turn off contact history logging in the Call List or Mail List process, the treatment history made in that process is not written to the database.

Offer history is written to the database for production runs only, not test runs.

Treatment history is not stored in separate tables by audience level; all treatment history is stored in the UA_Treatment table.

---

### Working with contact history

This section contains the following information:
- “Creating contact history tables for new audience levels”
- “Mapping contact history tables to Unica system tables”
- “To add a contact status code” on page 81
- “Logging history” on page 81
- “Updating contact history” on page 82
- “Clearing contact history” on page 82

### Creating contact history tables for new audience levels

When you create a new audience level, you may need to create a table in the Campaign system table database to store contact history and detailed contact history for targets and controls in that audience level.

When you create these tables, you must create indexes on them. For example, if you create the INDIV_ContactHistory table for a new Individual audience level, you could create an index as follows:

```sql
CREATE INDEX XIE1INDIV_ContactHistory ON INDIV_ContactHistory ( IndivID )
```

### Mapping contact history tables to Unica system tables

Each time you create a new audience level, you must map the contact history and detailed contact history system tables for the new audience level.

**Important:** You can delete contact statuses you do not intend to use, but you should not delete a contact status that is in use.
To add a contact status code

Before adding a contact status, see Default contact status codes to determine which existing status codes meet your needs and which ones you must create.

You define contact status codes in the UA_ContactStatus table in the Campaign system database.
1. Log in to the database management system that contains the Campaign system table database.
2. Open the UA_ContactStatus table.
3. Add rows for contact statuses you need to add. For each new status:
   a. Enter a unique ContactStatusID.
      
      **Note:** The ContactStatusID can be any unique positive integer within the internalIdLowerLimit and internalIdUpperLimit configuration parameter values. You set these values on the Configuration page in Marketing Platform. For more information, see the *IBM Unica Marketing Administrator’s Guide*.
   b. Enter a Name.
   c. Optionally, enter a Description.
   d. Enter a unique ContactStatusCode, using the values A-Z and 0-9.
   e. In the CountsAsContact column, enter 1 if the status represents a successful contact, or 0 if it does not.
      
      **Note:** This column is used by Optimize for managing contact fatigue. It also may be useful for queries against the contact history table to suppress individuals who have received a specific number of contacts within some time period.
   f. In the Defaults column, enter 0 if that status is not to be the default, or 1 if it is. Enter 2 for the default status for control cells. Ensure that only one row was the value 1 and one row has the value of 2 in this column.
4. Save the table changes.

If necessary, see the documentation for your database management system for detailed instructions on modifying data in tables.

Logging history

To log contact history, users configure one or more contact processes (Call List or Mail List). Then, when the flowchart is run in production (not test) mode, contact history is written to the tables related to the audience-levels used in the flowchart.

When logging to contact history is enabled, offer and treatment history are written as well.

**Note:** If the process is configured to log contact history, but runs on a cell with no selected targets, no history records are written.

Users can optionally choose to not have contact history logged by the Call List or Mail List process.

For more information, see the *Campaign User’s Guide*.
Updating contact history

To update contact history (for example, to update a contact status or additionally tracked field in contact history), users configure the Track process. For example, the input to the Track process may be an updated contact list received from a mail house with the list of targets who could not be contacted. When the flowchart containing the Track process is run in production mode, contact history is updated to the tables related to the audience-levels used.

For more information, see the Campaign User’s Guide.

Clearing contact history

Users can clear the contact history generated by a contact process while configuring it. They are also prompted to select run history options when re-running processes or branches that have existing contact history, as these types of runs do not increment flowchart Run IDs.

Users can clear all contact history generated by that particular process, a particular run instance (identified by run date and time), or all contacts made within a specified contact date range. The appropriate records are then permanently deleted from the contact history table for the audience level. The next time the flowchart is run, the contact history is replaced rather than appended in the contact history table.

For more information, see the Campaign User’s Guide.

Default contact status codes

Campaign is delivered with the following contact statuses, defined in the UA_ContactStatus table:

<table>
<thead>
<tr>
<th>Contact-StatusID</th>
<th>Name</th>
<th>Description</th>
<th>Contact-StatusCode</th>
<th>Counts-AsContact</th>
<th>Defaults</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Campaign Send</td>
<td>&lt;NULL&gt;</td>
<td>CSD</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>Delivered</td>
<td>&lt;NULL&gt;</td>
<td>DLV</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>Undelivered</td>
<td>&lt;NULL&gt;</td>
<td>UNDLV</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>4</td>
<td>Control</td>
<td>&lt;NULL&gt;</td>
<td>CTR</td>
<td>0</td>
<td>2</td>
</tr>
</tbody>
</table>
Chapter 8. Response history administration

Before you begin working with response history, you should read the audience level administration topics and set up required audience levels.

Response history is stored in the Campaign system database in separate tables by audience level; you therefore need to set up audience levels prior to working with response history.

In addition, you can find basic concepts about contact and response history, and information about setting up flowcharts to use the Response process, in the Campaign User’s Guide.

Response history concepts

This section contains the following information:
- “What is response history?”
- “What is the response type?”
- “How does response history relate to audience levels?”
- “How does response history relate to database tables?” on page 84
- “Foreign key constraints in response history tables” on page 84
- “What is an action table?” on page 84
- “What does an action table contain?” on page 84
- “Why use an action table?” on page 84

What is response history?

Response history is the historical record of responses to campaigns, either by targeted respondents, or by members of hold-out control groups, who might have performed the desired action despite not having been contacted.

For more information about response history in Campaign, and how to design flowcharts to record responses, see the Campaign User’s Guide.

What is the response type?

Response type is the indicator of the type of response made by the target. Campaign users specify the response type to use when configuring a Response process.

Campaign is delivered with a set of default response types. As an administrator, you can add additional types.

For more information about response types in Campaign, see the Campaign User’s Guide.

How does response history relate to audience levels?

Campaign records and maintains a separate response history for each audience level you have defined. Each audience level has its own related response history table in the Campaign system database, as well as a related Unica system table.
How does response history relate to database tables?
Response history tables, which must exist in the Campaign system database, store historical responses for each audience level.

The Customer audience level is delivered by default, and the history of responses from customers could be stored in the UA_ResponseHistory in the Campaign system database.

If you create an additional audience level, you must create the response history table for it in the Campaign system database.

After you create the table in the Campaign system database for a new audience level, you must map the new table to the Unica system table for the audience level’s response history, which is automatically created when you create the audience level.

Foreign key constraints in response history tables
Each response history table you create for a new audience level must have a foreign key constraint on the UA_Treatment table’s TreatmentInstID field. See the DDL file that creates the system tables for details on how to set up this constraint.

What is an action table?
An action table is an optional table containing data about targets’ responses to a campaign. An action table typically provides each target’s response type and actions of interest, as well as other campaign-specific data. The action table then serves as the source data of the input cell for the Response process.

An action table is audience level-specific; you typically create one action table for each audience level in Campaign.

Important: Ensure that any action table used for response tracking is locked during response processing. You must also clear rows after response processing to ensure that responses are not credited multiple times.

What does an action table contain?
Each row of the action table represents a single event, which must minimally contain the audience IDs, the response type, and the response date. It typically includes one or more response codes (campaign, cell, offer, or treatment codes) and one or more standard or custom offer attributes for inferred response tracking (for example, the purchased product or service). Any field that is populated in an event is used to match against possible treatments that have that offer attributes and any fields that are NULL are ignored.

Why use an action table?
Using an action table is a best practice meant to ensure that sufficient data about targets’ responses are recorded and available to use. Campaign is delivered with a sample action table for the Customer audience level, called UA_ActionCustomer in the system database.
Creating response history tables for new audience levels

When you create a new audience level, you must create a table in the Campaign system database to store response history for targets in that audience level.

When you create this table, you should also create an index on it to improve performance. For example, if you create the INDIV_ResponseHistory table for a new Individual audience level, you could create an index as follows:

```
INDEX XIE1INDIV_ResponseHistory ON INDIV_ResponseHistory ( IndivID )
```

Mapping response history tables to Unica system tables

After you create the response history table for a new audience level, you must map it to the Unica system table for the audience level response history.

To set the number of days after an offer expires to record responses

Note: To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the Marketing Platform Administrator’s Guide.

On the Configuration page, set the `allowResponseNDaysAfterExpiration` property in the `applications > Campaign > partitions > partition[n] > server > flowchartConfig` category to the desired number of days.

To add a response type

Before adding response types, see “Default response types” on page 86 to determine which existing types meet your needs and which you must create.

You define response types in the `UA_UsrResponseType` table in the Campaign system database.

1. Log in to the database management system that contains the Campaign system database.
2. Open the `UA_UsrResponseType` table.
3. Add rows for response types you need to add. For each new type:
   4. Enter a unique `ResponseTypeID`.
   5. Enter a `Name`.
   6. Optionally, enter a `Description`.
   7. Enter a unique `ResponseTypeCode`.
8. In the CountsAsResponse column, enter 1 if the type represents a successful response, 0 if it does not, or 2 if it represents a reject.

9. In the IsDefault column, enter 0 if that type is not to be the default, or 1 if it is. Ensure that only one row was the value 1 in this column.

10. Save the table changes.

11. Remap the UA_UsrResponseType system table.

   See the documentation for your database management system for detailed instructions on modifying data in tables.

Logging response history

To log response history, users configure the Response process. Then, when the flowchart is run, response history is written to the table(s) related to the audience-level(s) used in the flowchart.

For more information, see the Campaign User’s Guide.

Response history references

This section contains the following information:

- “Default response types”
- “Sample UA_ActionCustomer Table” on page 87

Default response types

Campaign is delivered with the following response types, defined in the UA_UsrResponseType table.

For each response type, valid values for the CountsAsResponse field are:

0 - does not count as a response

1 - counts as a positive response

2 - counts as a negative response

Note: The CountsAsResponse values are mutually exclusive for each response type. In other words, the same response type cannot be counted both as a response, and as a reject.

Table 24. Default response types

<table>
<thead>
<tr>
<th>ResponseTypeID</th>

Chapter 9. Operational monitoring

You use operational monitoring to see a single view of all active flowcharts.

Operational monitoring is an administration function. Only users with the Access monitoring page or Perform monitoring tasks security permission are allowed to view the Operational Monitoring page. Only users with the Perform monitoring tasks security permission are allowed to start, stop, or suspend flowcharts.

With the Perform monitoring tasks permission, a user is allowed to control all displayed flowcharts, regardless of the normal access rights they may have to each individual flowchart. Do not give this permission to end-users unless you intend to give them the right to stop, pause, and resume any running flowchart.

To configure operational monitoring

Note: To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the Marketing Platform Administrator’s Guide.

You must configure operational monitoring appropriately for your environment, including setting parameters for how long monitoring information is stored and displayed for historical flowchart runs.

On the Configuration page, set the properties in the Campaign > monitoring category as required. For information on the properties, see the context help or the Marketing Platform Administrator’s Guide.

To access the All Monitored Runs page

Note: You must have appropriate permissions to access the Monitoring page. For more information, see the Marketing Platform Administrator’s Guide.

Select Campaign > Monitoring. The All Monitored Runs page appears.

Viewing the All Monitored Runs page

On the All Monitored Runs page, Campaign groups active flowcharts by the campaigns that they belong to.

The status for each flowchart is indicated two ways: in the Status column, and by the colored status indicator. The action buttons that are available for each flowchart depend on the flowchart’s status.

For information about the colors and valid actions corresponding to each status, refer to the table in “Flowchart states and actions” on page 92.

Note: The action buttons are only available to you if you have the Perform monitoring tasks security permission.
To sort the list of flowcharts on the All Monitored Runs page

By default, flowcharts are sorted in ascending order by campaign name.

You can also sort the list of flowcharts by the Status, Run By, Start Time, or End Time column.

To sort the list of flowcharts, click the column name by which you want to sort.

The direction of the arrow to the right indicates if the column is sorted in ascending or descending order:
- An up arrow indicates the column is sorted in ascending order.
- An down arrow indicates the column is sorted in descending order.

To reverse the sorting order, click the column name again.

Note: If you leave the All Monitored Runs page and return to it, the flowcharts are listed in the default sort order (ascending by campaign name).

To view associated campaigns or flowcharts

From the All Monitored Runs page, you can open a flowchart or campaign summary. Blue underlining indicates that campaign or flowchart names are hypertext links.

To view a campaign summary, click the name of the campaign, which appears to the left in the Campaign and Flowchart(s) column.

To view a flowchart in Read Only mode, click the name of the flowchart, which appears to the right of the campaign name, in italics.

To refresh the All Monitored Runs page display

The Refresh feature allows you to update the contents of the All Monitored Runs page, to ensure that you are viewing current operational details.

To refresh the All Monitored Runs page, click Refresh at the top right. The page refreshes with current data.

Working with flowcharts through the All Monitored Runs page

Note: You must have permissions to work with flowcharts from the All Monitored Runs page.

If you have the Perform monitoring tasks security permission, you can perform the following actions on flowcharts on the All Monitored Runs page. The actions that you can perform on a flowchart depend on its current status.

Note: You can also Pause, Continue or Stop a flowchart from the Run menu on a flowchart page. The Pause and Continue actions are only available from the flowchart Run menu. For more details, see the Campaign User’s Guide.
To stop a running flowchart

You can perform the Stop action only on a running flowchart.

1. On the All Monitored Runs page, locate the flowchart that you want to stop.
   You see its status and the available action buttons.

2. Click the Stop button next to the flowchart status.
   The flowchart stops. Its status on the All Monitored Runs page changes to Stopped and the status indicator color changes to red.

To suspend a running flowchart

You can perform the Suspend action only on a running flowchart.

When you Suspend a flowchart, the run process ends, and system resources are released. A placeholder remains so that you can resume running the flowchart at the point at which you suspended it. This is different from pausing a flowchart (from the flowchart Run menu). When you pause a flowchart, the process remains, and does not release system resources (such as memory).

1. On the All Monitored Runs page, locate the flowchart that you want to suspend. You see its status and the available action buttons.

2. Click the Suspend button next to the flowchart status.
   The suspend process starts. The flowchart’s status on the All Monitored Runs page changes to Suspending and the color of the status indicator changes to yellow. In Suspending status, you cannot perform any actions on a flowchart.

   Note: It may take a while to successfully suspend a running flowchart, because it must wait until running process boxes reach a state where they can be safely saved and resumed.

   When the suspend process completes, the flowchart’s status changes to Suspended; the color of the status indicator remains yellow.

To resume a suspended flowchart

You can resume a suspended flowchart. This restarts the flowchart and continues running it at the point at which you suspended it.

1. On the All Monitored Runs page, locate the suspended flowchart that you want to resume. You see its status and the available action buttons.

2. Click the Resume button next to the flowchart status.
   The flowchart resumes running. Its status on the All Monitored Runs page changes to Running and the color of the status indicator changes to green.

Operational monitoring references

This section contains the following reference information:

- “Flowchart states and actions” on page 92
- “Properties related to operational monitoring” on page 93
Flowchart states and actions

The valid flowchart states in the All Monitored Runs page, and the actions that are available for each status, are shown in the following table.

The flowchart status reflects the status of the last run.

**Note:** If a user runs a flowchart and one branch succeeds, but another process in that flowchart but not in that branch has failed, the flowchart status is **Failed**.

*Table 26. Flowchart states and actions*

<table>
<thead>
<tr>
<th>Status (Status Indicator Color)</th>
<th>Description</th>
<th>Valid Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Running</strong> (Green)</td>
<td>The flowchart is running.</td>
<td>• Suspend</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Stop</td>
</tr>
<tr>
<td><strong>Paused</strong> (Yellow)</td>
<td>The flowchart was paused during running from the flowchart Run menu. (You cannot pause a flowchart from the Monitoring page.) When a flowchart is paused, the process remains intact but stops processing, guaranteeing that no work is lost when the flowchart run is continued. Note that with the Pause action, system resources are not released (CPU utilization stops, but memory is not freed). You can continue running a paused flowchart from the flowchart Run menu. For details about pausing and continuing a flowchart run, see the <em>Campaign User's Guide</em>.</td>
<td>None from the Monitoring page (Run&gt;Continue from the flowchart)</td>
</tr>
<tr>
<td><strong>Suspending</strong> (Yellow)</td>
<td>The flowchart “Suspend” action has been initiated from the Monitoring page and the flowchart is transitioning to this status.</td>
<td>None</td>
</tr>
<tr>
<td><strong>Suspended</strong> (Yellow)</td>
<td>The flowchart Suspend action has completed and the flowchart is in a suspended state. The process is shut down and system resources have been released; a placeholder remains to enable restarting the flowchart run at the point at which it was suspended. You can resume running a suspended flowchart using the Resume button on the Monitoring page. <strong>Note:</strong> Running process boxes that can be rerun from the beginning, resulting in the same net behavior, are immediately stopped when the Suspend command is issued, and any partially completed work is lost. These process boxes will be re-run when the flowchart run is resumed.</td>
<td>• Resume</td>
</tr>
</tbody>
</table>
Table 26. Flowchart states and actions (continued)

<table>
<thead>
<tr>
<th>Status (Status Indicator Color)</th>
<th>Description</th>
<th>Valid Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Succeeded (Light blue)</td>
<td>The flowchart run completed successfully, without any errors.</td>
<td>None</td>
</tr>
<tr>
<td>Stopped (Red)</td>
<td>The flowchart run was stopped either by a user from the flowchart Run menu or due to an error (that is, one or more process boxes in the flowchart encountered an error). For details about stopping a flowchart from the flowchart Run menu, see the Campaign User’s Guide.</td>
<td>None</td>
</tr>
<tr>
<td>Failed (Red)</td>
<td>The run failed due an unhandled error or a server error (that is, the flowchart server process exited unexpectedly).</td>
<td>None</td>
</tr>

</tbody>
</table>
Chapter 10. Dimension hierarchy administration

This section contains the following information:
• “What is a dimension hierarchy?”
• “Why use dimension hierarchies?”
• “About dimension hierarchies and cubes” on page 96
• “About dimension hierarchies and database tables” on page 96

What is a dimension hierarchy?

A dimension hierarchy is a data construct used to group data into bins based on value ranges. A dimension hierarchy can contain multiple levels, each of which has its own set of bins. The bins in each lower level must roll up neatly into bins in higher levels.

For example, the Age dimension hierarchy could have two levels, Lowest level and Rollups. Customers are grouped in bins at each level:

**Lowest level:** (21-25), (26-30), (31-35), (36-45), (45-59), (60+)

**Rollups:** Young (21-35), Middle (36-59), Older (60+)

**Note:** You cannot split a lower level bin (for example, bin 26-30 above) and divide individuals aged 26-27 into “young” and “28-30” into “middle”, when rolling up to a higher level. Any single bin in a lower level must fall completely within a higher level bin. If you wanted to actually define “young” as those aged 21-27, you would need to create separate bins (for example, 26-27 and 28-30) in the lower level so they could roll up into “young” and “middle,” respectively.

Other commonly specified dimension hierarchies are time, geography, product, department, and distribution channel. However, you can create any kind of dimension hierarchy that relates to your business or campaign.

Why use dimension hierarchies?

As the building blocks of cubes, dimension hierarchies are the basis for a variety of reports that can be used for data exploration, quick counts, or as a basis for targeting campaigns. Cubes can pre-aggregate counts or simple calculations (sum, min, max, mean, standard deviation) of numeric fields (for example, total sales across all products at increasing aggregation levels, cross-tabular analysis of expenses versus sales by geography, and so forth).

Dimension hierarchies are also available as a means of selecting directly from strategic segments (without requiring any cubes to be built or to work from a cross-tab report).

Campaign supports:
• Dimensions that are comprised of an unlimited number of levels and elements
• Data points built as input to customer analytic reporting and visual selection
• Rollups into unlimited number of categories to support drill-down capability
### About dimension hierarchies and cubes

You use dimension hierarchies to create dynamic data cubes, precalculated two- or three-dimensional aggregations of customer data built on a strategic segment. Cubes are used for data exploration or visual selection, as you have the ability to drill through the data and use the resulting set of customers as a new cell in a flowchart.

For details about cubes, see the *Campaign User’s Guide*.

### About dimension hierarchies and database tables

When you create a dimension hierarchy in Campaign, you map it to a table in a database or a flat file. The table must contain columns for:

- The dimension name
- Each level in the dimension hierarchy
- The raw SQL or Unica expression that defines the audience entities in the bin
- The data source

For example, the *Age* dimension hierarchy has three levels. The first level is *All ages*, followed by the two levels shown in the two levels of the following list:

- Under 30
  - Under 20
  - 20 to 25
  - 26 to 30
- 30 to 50
  - 30 to 40
  - 41 to 50
- Over 50
  - 51 to 60
  - Over 60

This dimension hierarchy is based on the following database table:

<table>
<thead>
<tr>
<th>Dimension-Name</th>
<th>Dim1Name</th>
<th>Dim2Name</th>
<th>Dim3Name</th>
<th>Expression</th>
<th>Datasource</th>
</tr>
</thead>
<tbody>
<tr>
<td>MemberAge</td>
<td>All Ages</td>
<td>Under 30</td>
<td>&lt; 20 Years Old</td>
<td>age &lt; 20</td>
<td>Your datamart</td>
</tr>
<tr>
<td>MemberAge</td>
<td>All Ages</td>
<td>Under 30</td>
<td>20 - 25 Years Old</td>
<td>age between 20 and 25</td>
<td>Your datamart</td>
</tr>
<tr>
<td>MemberAge</td>
<td>All Ages</td>
<td>Under 30</td>
<td>26 - 30 Years Old</td>
<td>age between 26 and 30</td>
<td>Your datamart</td>
</tr>
<tr>
<td>MemberAge</td>
<td>All Ages</td>
<td>30 - 50 Years</td>
<td>30 - 40 Years Old</td>
<td>age between 31 and 40</td>
<td>Your datamart</td>
</tr>
<tr>
<td>MemberAge</td>
<td>All Ages</td>
<td>30 - 50 Years</td>
<td>41 - 50 Years Old</td>
<td>age between 41 and 50</td>
<td>Your datamart</td>
</tr>
<tr>
<td>MemberAge</td>
<td>All Ages</td>
<td>Over 50</td>
<td>51 - 60 Years Old</td>
<td>age between 51 and 60</td>
<td>Your datamart</td>
</tr>
</tbody>
</table>
Working with dimension hierarchies

This section contains the following information:
- “About working with dimension hierarchies”
- “Designing dimension hierarchies”
- “Accessing dimension hierarchies in Campaign”
- “To create a dimension hierarchy” on page 98
- “To load a stored dimension hierarchy” on page 98
- “To edit a dimension hierarchy” on page 99
- “To update a dimension hierarchy” on page 99
- “To remove a dimension hierarchy” on page 99

About working with dimension hierarchies

To use dimension hierarchies in Campaign, you must do the following:
- Define and create a dimension hierarchy in a database table in your data mart or defined in a delimited or fixed-width flat file.
- Map this table or flat file to a dimension hierarchy in Campaign.

When this dimension hierarchy is mapped into Campaign, the dimension hierarchy is available in a Cube process for building dynamic data cubes on strategic segments.

You or a Unica consulting team must create the dimension hierarchy definition in the data mart or flat file. This is an operation external to Campaign. Also, the lowest level of the dimension hierarchy must use either raw SQL or a pure Unica expression (no custom macros, user variables, or derived fields) to define the individual audience ID membership for each bin.

Designing dimension hierarchies

You should consider the following when designing dimension hierarchies:
- How dimensions relate to each other (for example, Age/Geography/Timespan).
- Level of detail for each dimension and cube.
- Dimensions are not limited to a single cube; they can be used in many cubes.
- Dimensions must roll up cleanly across boundaries, so elements must be mutually exclusive and not overlap.

Accessing dimension hierarchies in Campaign

You can work with dimension hierarchies:
- When editing a flowchart, by clicking the Admin icon and selecting Dimension Hierarchies.
- Through the Campaign Settings page, by clicking Manage Dimension Hierarchies.

---

Table 28. Dimension hierarchy database table (continued)

<table>
<thead>
<tr>
<th>Dimension-Name</th>
<th>Dim1Name</th>
<th>Dim2Name</th>
<th>Dim3Name</th>
<th>Expression</th>
<th>Datasource</th>
</tr>
</thead>
<tbody>
<tr>
<td>MemberAge</td>
<td>All Ages</td>
<td>Over 50</td>
<td>Over 60</td>
<td>age &gt; 60</td>
<td>Your datamart</td>
</tr>
</tbody>
</table>
Note: When dimension hierarchies are used to create cubes, we recommend that you use the Cube process to create dynamic data cubes from a flowchart in the Sessions area of the application.

To create a dimension hierarchy

These instructions assume that a table with a dimension hierarchy definition is already available.
1. Open the Dimension Hierarchies window.
2. In the Dimension Hierarchies window, click New Dimension.
The Edit Dimension window opens.
3. Enter the following details for the new dimension hierarchy:
   - The Dimension Name
   - A Description
   - The Number of Levels in the dimension hierarchy. This should correspond to the hierarchical levels in the table to which you are mapping this dimension hierarchy.
   - If you are using this dimension hierarchy as the basis for a cube, ensure that Elements are Mutually Exclusive is checked (by default, this option is checked). Otherwise, you will receive an error when you use this dimension hierarchy to create a cube because the elements cannot overlap in a cube. If you are creating a dimension hierarchy purely for use in selecting from a strategic segment, then it is permissible to disable this option and create overlapping definitions. It is recommended, however, that you create non-overlapping bins so that dimension hierarchies you create can be freely used both for building cubes as well as with strategic segments.
4. Click Map Table.
The Edit Table Definition window opens.
5. To map your dimension hierarchy table to either a table in the database or a flat file containing the dimension hierarchy definition, follow the instructions in “To map a base record table to an existing database table” on page 30.
   After you finish mapping your dimension hierarchy, you return to the Edit Dimension window, which now includes details for the new dimension hierarchy.
6. Click OK.
   You return to the Dimensions window.
7. (Optional but recommended) You can store a dimension hierarchy for future use in a table catalog by clicking Save. If you store a dimension hierarchy you can retrieve it later for another use or share it with other users rather than recreating it.

To load a stored dimension hierarchy

Dimension hierarchies are stored in table catalogs with any other mapped tables in the flowchart.
1. Open the Dimension Hierarchies window.
2. Click Load.
3. Select the table catalog containing the dimension hierarchies that you want to load.
4. Click Load Catalog. The dimension hierarchies are loaded.
To edit a dimension hierarchy

1. Open the Dimension Hierarchies window.
2. You may need to load the dimension hierarchy you want to edit.
3. Select the dimension hierarchy you want to edit.
4. Click Edit.
5. Modify the following details for the dimension hierarchy:
   - The Dimension Name
   - A Description
   - The Number of Levels in the dimension hierarchy. This should correspond to the hierarchical levels in the database table to which you are mapping this dimension hierarchy.
   - If you are using this dimension hierarchy as the basis for a cube, ensure that Elements are Mutually Exclusive is checked (by default, this option is checked). Otherwise, you will receive an error when you use this dimension hierarchy to create a cube because the elements cannot overlap in a cube.
6. To modify the table mapping, click Map Table. The Edit Table Definition window opens.
7. Follow the instructions in “To map a base record table to an existing database table” on page 30.
8. After you finish mapping your dimension, you return to the Edit Dimension window, which now includes details for the new dimension hierarchy.
9. Click OK.
   You return to the Dimensions window.
10. (Optional but recommended) You can store your changes to any dimension hierarchies for future use in a table catalog by clicking Save.

To update a dimension hierarchy

Campaign does not support automatic updates of dimension hierarchies. If the underlying data changes, you must manually update your dimensions.

Note: Cubes are comprised of dimension hierarchies which are based on strategic segments, so you must update cubes whenever you update strategic segments.
1. Open the Dimension Hierarchies window.
2. You may need to load the dimension hierarchy you want to edit.
3. Select the table catalog containing the dimension hierarchies that you want to update.
4. Click Update.

To remove a dimension hierarchy

Important: Removing a dimension hierarchy makes it no longer available to strategic segments. Any cubes based on the dimension hierarchy will become unconfigured if they use a deleted dimension hierarchy.

If you delete a dimension hierarchy from a table catalog, it does not affect any existing flowcharts (as those flowcharts contain a copy of the dimension hierarchy definition).
1. Open the Dimension Hierarchies window.
2. You may need to load the dimension hierarchy you want to update.
3. Select the dimension hierarchies you want to remove.
4. Click Remove.
   You are prompted to confirm the removal.
Chapter 11. Trigger administration

Campaign allows you to define inbound and outbound triggers that can be used in all flowcharts in a partition.

Note: Triggers defined in Campaign flowcharts are not used with the IBM Unica Scheduler. For information on using triggers with the IBM Unica Scheduler, see the Marketing Platform Administrator’s Guide.

What is an inbound trigger?

An inbound trigger is a message that is broadcast to one or more campaigns. You can configure a flowchart to “listen” for a particular trigger to start the execution of one or more processes. Third-party systems typically send the trigger based on the occurrence of some external event.

Why use an inbound trigger?

Following are examples of events that might cause an inbound trigger to start a process in Campaign:

- A database update triggers the recomputation of all strategic segments (for example, high, medium, and low value customer classifications based on the most recent purchase activity).
- A predictive model updating its scores in the database triggers an acquisition campaign, which is waiting for the latest scores, to run.
- A third-party scheduling tool is used to schedule and trigger the execution of flowcharts.
- The run completion of Optimization session triggers the execution of the participating campaigns to retrieve and process their optimized results.

Inbound triggers and the Schedule process

When configured to do so, the Schedule process listens for inbound triggers and executes when one is broadcast.

What is broadcasting?

Broadcasting is the process of notifying all flowcharts in Campaign, specific campaigns, or specific flowcharts that an inbound trigger has executed. Schedule processes configured to listen for that inbound trigger then execute.

To send an inbound trigger to a campaign or flowchart, you must broadcast the triggers to Campaign using the trigger utility, CAMPAIGN_HOME/bin/unica_actrg.exe.

What is an outbound trigger?

An outbound trigger is the execution of a command, batch file, or script that takes place after a flowchart or process is run. You can define triggers to perform virtually any action, such as opening an application, sending an email, or running a program.
Campaign can execute an outbound trigger when a Schedule, Call List, or Mail List process executes. For example, when a Call List process completes, an outbound trigger can send an automatic email informing a manager that a list of contacts is ready.

**Note:** Triggers execute on completion of test runs as well as of production runs.

Campaign can also automatically execute an outbound trigger when a flowchart runs. You can configure different triggers for when the flowchart completes successfully, or fails.

An outbound trigger can be synchronous or asynchronous.

### Synchronous outbound triggers

When Campaign runs an outbound trigger synchronously, the process that called it waits for the executed command to complete and return with a success or failure status. In other words, the flowchart does not continue running until the results of the trigger are returned. If the trigger fails, as indicated by a non-zero return value, the process box does not continue processing and indicates an error (with a red X) and an appropriate error message.

Synchronous execution is useful when the flowchart is waiting for an external process to complete its work before continuing. For example, a synchronous outbound trigger could run third-party predictive model scores in real-time, and the flowchart would wait until it completed before selecting from the updated model scores.

To make an outbound trigger synchronous, put a question mark (?) after the trigger name when you specify the trigger in the process configuration. For example:

```plaintext
EmailUpdate ?
```

### Asynchronous outbound triggers

When an asynchronous outbound trigger executes, the flowchart processing continues immediately; the process that called the trigger does not wait for it to succeed or fail.

To make an outbound trigger asynchronous, you do not have to add a termination character. However, to ensure that it is explicitly understood that the trigger is asynchronous, you can put an ampersand (&) after the trigger name when you specify the trigger in the process configuration. For example:

```plaintext
EmailUpdate &
```

### Why use an outbound trigger?

Outbound triggers may be useful in a variety of cases where you want to execute an action related to, but external to, a campaign. Some typical examples of useful outbound triggers include:

- Sending an email notification upon completion of a campaign flowchart;
- Sending an email notification or performing some other task if a flowchart fails;
- Running a third-party modeling tool, such as SAS, to generate real-time results inline with the flowchart logic;
• Running a Unix shell script to send an output file by FTP after the file has been created;
• Launching a customer database update;
• Launching or triggering another flowchart.

Return values for outbound triggers

Programs executed by an outbound trigger should return 0 on success, and a non-zero value on failure.

How are triggers defined?

You define triggers when editing a flowchart. A trigger that you define in one flowchart is available to all flowcharts in the same partition.

The executable file for a trigger must be stored in the \texttt{CAMP\_HOME/partitions/partition\_name} directory. You can create a subdirectory, triggers, in this location, or use other subfolders as desired.

Working with trigger folders and triggers

This section contains the following tasks:
• “To create folders to organize triggers”
• “To move a trigger folder”
• “To edit a trigger folder” on page 104
• “To delete a trigger folder” on page 104
• “To create a trigger” on page 104
• “To edit or move a trigger” on page 105
• “To delete a trigger” on page 106

To create folders to organize triggers

Note: You must have permissions to create folders for triggers.
1. When editing a flowchart, select Tools > Stored Triggers.
   The Stored Trigger Definitions window opens.
2. Click New Folder.
   The Create Folder window opens.
3. Enter a Name for the folder.
4. Optionally, enter a Note.
5. In the Create Under drop-down list, select the folder in which to create the new folder, or select None to create a top-level folder.
6. If you are creating a top-level folder, select a security policy.
   A sub-folder automatically inherits its security policy from its parent folder.
7. Click Save.

To move a trigger folder

Note: You must have permissions to move trigger folders.
1. When editing a flowchart, click the Options icon and select Stored Triggers.
   The Stored Trigger Definitions window opens.
2. In the left pane, select the folder you want to move.
3. Click Edit/Move. The Edit Folder window opens.
4. In the Create Under drop-down list, select the folder under which you want to move the selected folder, or select None to make the folder a top-level folder.
5. If you are moving the folder to the top-level, select a security policy.
   A sub-folder automatically inherits its security policy from its parent folder.
6. Click Save.

To edit a trigger folder

**Note:** You must have permissions to edit trigger folders.

1. When editing a flowchart, click the Options icon and select Stored Triggers.
   The Stored Trigger Definitions window opens.
2. In the left pane, select the folder you want to edit.
3. Click Edit/Move.
   The Edit Folder window opens.
4. Edit the Name for the folder.
5. Edit the Note.
6. In the Create Under drop-down list, select the folder under which you want to move the selected folder, or select None to make the folder a top-level folder.
7. If you are editing a top-level folder, select a security policy.
   A sub-folder automatically inherits its security policy from its parent folder.
8. Click Save.

To delete a trigger folder

**Note:** You must have permissions to delete trigger folders.

1. When editing a flowchart, click the Options icon and select Stored Triggers.
   The Stored Trigger Definitions window opens.
2. In the left pane, select the folder you want to delete.
3. Click Remove.
   You are prompted to confirm the deletion.
4. Click OK.

To create a trigger

**Note:** You must have permissions to create triggers.

1. When editing a flowchart, select Tools > Stored Triggers.
   The Stored Trigger Definitions window opens.
2. Click New Item.
   The data fields for the new trigger appear on the right of the window.
3. Optionally, select a folder to save the trigger to in the Save Under drop-down list.

**Note:** The folder location you select governs which users can access the trigger, based on the folder’s security policy.
4. Enter a name for the trigger in the Name field.
   • You cannot use spaces in the string, but you can use underscores (_).
• This name must be unique within the folder where you save it.

5. If you are creating a trigger in the top-level folder, select a security policy, or keep the default.

6. Optionally, enter a description of the trigger in the Note field.
   You can provide a free-form text description of the trigger for documentation purposes. You also may want to keep a modification history of who modified the trigger, when, and what changes were made.

7. In the Command field, enter the path relative to the current partition root and file-name of the executable file on the Campaign server. You can click Browse to visually select the executable file from within the current partition.
   If you are creating an outbound trigger, to make it synchronous, terminate the command with a question mark (?)
   To make the trigger asynchronous, do not terminate the command with a special character, or use an ampersand (&).

8. Click Save to save the trigger.

9. Click Close to exit the Stored Trigger Definitions window.

To edit or move a trigger

Note: You must have permissions to edit or move triggers.

1. When editing a flowchart, select Tools > Stored Triggers.
   The Stored Trigger Definitions window opens, displaying all triggers defined within the current Campaign partition.

2. Locate and select the trigger to edit in the Items List.

3. Click Edit/Move.
   The data fields for the trigger appear on the right of the window.

4. Optionally, change the folder to save the trigger to in the Save Under drop-down list.

   Note: The folder location you select governs which users can access the trigger, based on the folder’s security policy.

5. Optionally, modify the trigger name in the Name field.
   • You cannot use spaces in the string, but you can use underscores (_).
   • This name must be unique within the folder where you save it.

   Important: If you change the trigger name, any processes referring to that trigger will become unconfigured and will be unable to run. You will need to edit each process to refer to the new trigger name.

6. If you are modifying a trigger in the top-level folder, or moving a trigger to the top-level folder, select a security policy, or keep the default.

7. Optionally, modify the description of the trigger in the Note field.

8. Optionally, in the Command field, modify the path relative to the current partition root and file-name of the executable file on the Campaign server. You can click Browse to visually select the executable file from within the current partition.
   If you are creating an outbound trigger, to make it synchronous, terminate the command with a question mark (?).
   To make the trigger asynchronous, do not terminate the command with a special character, or use an ampersand (&).

9. Click Save to save the trigger.
10. Click **Close** to exit the Stored Trigger Definitions window.

**To delete a trigger**

**Note:** You must have permissions to delete triggers.

If you delete a trigger, any processes referring to that trigger will become unconfigured and will be unable to run. You must edit each process to remove the reference to the deleted trigger.

1. When editing a flowchart, select **Tools > Stored Triggers**.
   
   The Stored Trigger Definitions window opens, displaying all triggers defined within the current Campaign partition.
2. Locate and select the trigger to delete in the **Items List**.
3. Click **Remove**.
   
   You are prompted to confirm the deletion.
4. Click **OK** to delete the trigger.
5. Click **Close** to exit the Stored Trigger Definitions window.

**Setting up outbound triggers**

**Note:** You must have permissions to use triggers in a flowchart.

This section contains the following topics:

- “Setting up a process to execute an outbound trigger”
- “To set up a flowchart to execute an outbound trigger on success”
- “To set up a flowchart to execute an outbound trigger on failure” on page 107

**Setting up a process to execute an outbound trigger**

You can have outbound triggers execute when one of the following processes runs:

- Schedule
- Call List
- Mail List

In the **Schedule** process, you specify the trigger(s) to execute in the **Schedule** tab.

In the Call List and Mail List processes, you specify the trigger(s) to execute in the **Fulfillment** tab.

For information on configuring these processes, see the *Campaign User’s Guide*.

**To set up a flowchart to execute an outbound trigger on success**

1. When editing a flowchart, click the **Admin** icon and select **Advanced Settings**.
   
   The Advanced Settings window opens.
2. Select the trigger to execute in the **Send Trigger(s) on Flowchart Success**.
   
   To use multiple triggers, enter the name of each trigger, separated by spaces.
3. Click **OK** to save the settings.
   
   The selected triggers execute when the flowchart runs successfully, on both production and test runs.
To set up a flowchart to execute an outbound trigger on failure

1. When editing a flowchart, click the **Admin** icon and select **Advanced Settings**.
   The Advanced Settings window opens.
2. Select the trigger to execute in the **Send Trigger(s) on Flowchart Run Error**.
   To use multiple triggers, enter the name of each trigger, separated by spaces.
3. Click **OK** to save the settings.
   The selected triggers execute when the flowchart encounters an error when running, on both production and test runs.

Setting up inbound triggers

This section contains the following:
- “To set up inbound triggers”
- “Configuring the Schedule process to run with an inbound trigger”
- “To broadcast a trigger to all flowcharts of a campaign” on page 108
- “To broadcast a trigger to a flowchart” on page 108
- “To broadcast a trigger to all campaigns” on page 108

**Note:** You must have permissions to use triggers in a flowchart.

To set up inbound triggers

1. Create the triggers within a flowchart, as described in “To create a trigger” on page 104.
2. Configure the Schedule process in any flowcharts you want to run when receiving the inbound trigger, as described in “Configuring the Schedule process to run with an inbound trigger.”
3. Use the Unica Trigger Utility `unica_actrg` (in the folder `Campaign_home/bin`) to broadcast triggers, as described in:
   - “To broadcast a trigger to all flowcharts of a campaign” on page 108
   - “To broadcast a trigger to a flowchart” on page 108
   - “To broadcast a trigger to all campaigns” on page 108

Configuring the Schedule process to run with an inbound trigger

To use an inbound trigger to run a flowchart, that flowchart must start with a Schedule process configured as follows:

- In the **Schedule to Run** drop-down list, select **Custom Run**.
- Check **Run on Trigger(s)**.
- In the **Run on Trigger(s)** field, enter the names of triggers that when broadcast will run the flowchart. Separate multiple triggers with spaces.

The Schedule process may also be configured to execute based on other conditions. Configuring the trigger condition will additionally execute the subsequent processes when the specified triggers are received.

**Important:** For a flowchart to run upon receipt of an inbound trigger, it must have a Schedule process configured as described above, and it must be running. Running the flowchart puts the flowchart into a “waiting,” or “listening”, state so...
that the flowchart is ready to execute when the trigger is received. A flowchart that is not running when the trigger is broadcast will not execute.

For more information about configuring the Schedule process, see the Campaign User’s Guide.

**To broadcast a trigger to all flowcharts of a campaign**

Run the Unica Trigger Utility with the following syntax:

```
unica_actrg campaign_code trigger_name
```

For example:

```
unica_actrg C003 web_hit
```

If a flowchart in the specified campaign starts with a Schedule process configured to run when receiving a broadcast based on the `web_hit` inbound trigger, that flowchart runs when the broadcast trigger is received.

**To broadcast a trigger to a flowchart**

Run the Unica Trigger Utility with the following syntax:

```
unica_actrg -n flowchart_name trigger_name
```

For example:

```
unica_actrg -n account_inquiry_flowchart web_hit
```

The trigger is broadcast only to all running flowcharts with the specified name. If the flowchart of the specified name starts with a Schedule process configured to run when receiving a broadcast based on the `web_hit` inbound trigger, that flowchart runs when the broadcast trigger is received.

**To broadcast a trigger to all campaigns**

Run the Unica Trigger Utility with the following syntax:

```
unica_actrg * trigger_name
```

For example:

```
unica_actrg * web_hit
```

The trigger is broadcast to all flowcharts in all campaigns. If any flowchart starts with a Schedule process configured to run when receiving a broadcast based on the `web_hit` inbound trigger, that flowchart runs when the broadcast trigger is received.

**Note:** On UNIX servers, the asterisk must either be escaped (`\*`) or enclosed in double quotation marks (`"*"`).
Setting up the trigger utility on a remote Windows machine

You can configure a Windows machine for sending triggers to a Campaign installation on UNIX. Follow these steps to set up the `unica_actrg` utility and required files on a remote Windows machine:

1. Obtain the required files.
   - You can copy the files from another Campaign installation on Windows, or install Campaign to obtain the files.
   - For a list of required files, see “`unica_actrg` utility: required files.” For information on installing Campaign, see the installation documentation.
   - If you run the installer to obtain the trigger utility files and you want to remove the unnecessary files, copy the files required for the trigger utility to another directory, then uninstall Campaign. For information on uninstalling Campaign, see the *IBM Unica Campaign Installation Guide*.

2. Open a command prompt on the remote Windows machine.

3. If it is not already set, set the `CAMPAIGN_HOME` environment variable on the remote Windows machine. For example:
   ```
   set CAMPAIGN_HOME=C:\Unica\Campaign
   ```
   When you run `unica_actrg.exe`, specify the port and server name of the machine where the Campaign installation is located.

**unica_actrg utility: required files**

The following files are required for executing the Campaign trigger utility (`unica_actrg`) on a remote Windows machine:

<table>
<thead>
<tr>
<th>Directory</th>
<th>File name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CAMPAIGN_HOME&gt;</code>\bin</td>
<td><code>iconv.dll</code></td>
</tr>
<tr>
<td></td>
<td><code>intl.dll</code></td>
</tr>
<tr>
<td></td>
<td><code>libeay32.dll</code></td>
</tr>
<tr>
<td></td>
<td><code>ssleay32.dll</code></td>
</tr>
<tr>
<td></td>
<td><code>tls4d.dll</code></td>
</tr>
<tr>
<td></td>
<td><code>unica_actrg.exe</code></td>
</tr>
<tr>
<td></td>
<td><code>xerces-c_1_4.dll</code></td>
</tr>
<tr>
<td><code>&lt;CAMPAIGN_HOME&gt;</code>\conf</td>
<td><code>config.xml</code></td>
</tr>
</tbody>
</table>

**Reference information for trigger administration**

References in this section include:
- “Tokens supported by triggers” on page 110
- “Unica trigger utility options” on page 111
- “Unica trigger utility syntax” on page 111
Tokens supported by triggers

Tokens can be used in the command line of an outbound trigger to pass specific information from the running flowchart.

The following table lists the tokens supported by triggers and the processes where specific tokens are available.

**Table 30. Tokens supported by triggers**

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
<th>Where Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AMUSER&gt;</td>
<td>The IBM Unica Marketing user name of the user running the flowchart.</td>
<td>Processes that support outbound triggers.</td>
</tr>
<tr>
<td>&lt;CAMPCODE&gt;</td>
<td>The campaign code associated with the current campaign.</td>
<td>Processes that support triggers, trigger on failure, trigger on success.</td>
</tr>
<tr>
<td>&lt;CONTACTLIST&gt;</td>
<td>Contact list specified in a contact process.</td>
<td>Call List and Mail List processes.</td>
</tr>
<tr>
<td></td>
<td>If the Contact List is written to a file, the appropriate full path name and file name replace the trigger token.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the Contact List is written to a database table, the token is simply removed.</td>
<td></td>
</tr>
<tr>
<td>&lt;CONTACTLOG&gt;</td>
<td>The log of the particular contact process.</td>
<td>Call List and Mail List processes.</td>
</tr>
<tr>
<td></td>
<td>When the Log is written to a file, the appropriate full path name and file name replace the trigger token.</td>
<td></td>
</tr>

<td>&lt;FLOWCHARTFILENAME&gt;</td>
<td>Full path name of a flowchart’s .ses file</td>
<td>Processes that support outbound triggers.</td>
</tr>
<tr>
<td>&lt;IXUSER&gt;</td>
<td>The user name of the Distributed Marketing user.</td>
<td>Processes that support triggers, trigger on failure, trigger on success.</td>
</tr>
<tr>
<td>&lt;OUTPUTTEMPTABLE&gt;</td>
<td>A token for use in raw SQL in pre- and post-processing under the Advanced window to create a temp table. For example:Create &lt;OUTPUTTEMPTABLE&gt; as SELECT CustIDs from CustomerTable WHERE ...</td>
<td>Select process.</td>
</tr>
<tr>
<td>&lt;OWNER&gt;</td>
<td>The Marketing Platform security user name of the user who created the flowchart.</td>
<td>Processes that support triggers, trigger on failure, trigger on success.</td>
</tr>
<tr>
<td>&lt;PROCESSNAME&gt;</td>
<td>The name of the current process box.</td>
<td>Processes that support triggers.</td>
</tr>
<tr>
<td>&lt;PROCESSID&gt;</td>
<td>The ID of the current process box.</td>
<td>Processes that support triggers.</td>
</tr>
</tbody>
</table>
Table 30. Tokens supported by triggers (continued)

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
<th>Where Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;SESSIONID&gt;</td>
<td>The ID of the current flowchart.</td>
<td>Processes that support triggers, trigger on failure, trigger on success.</td>
</tr>
<tr>
<td>&lt;SESSIONNAME&gt;</td>
<td>The name of the current flowchart.</td>
<td>Processes that support triggers, trigger on failure, trigger on success.</td>
</tr>
<tr>
<td>&lt;UserVar. UserVarName&gt;</td>
<td>Any user variable value. The user variable must be defined in current flowchart.</td>
<td>Processes that support triggers, trigger on failure, trigger on success.</td>
</tr>
</tbody>
</table>

Unica trigger utility syntax

```
[-p <port>] [-s <server_name>] [-v] [<campaign_code> | -n "<flowchart_name>"] "<trigger1>" "<trigger2>" ...
```

Unica trigger utility options

The `unica_actrg` utility supports the following options.

Table 31. Unica trigger utility options

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>-p &lt;port&gt;</td>
<td>The port that you want to use to run the utility.</td>
</tr>
<tr>
<td>-s &lt;server_name&gt;</td>
<td>The name of the Campaign server.</td>
</tr>
<tr>
<td>-v</td>
<td>Reports the version of the Unica Trigger Utility.</td>
</tr>
<tr>
<td>&lt;campaign_code&gt;</td>
<td>The identifier of the campaign that contains all the flowcharts that you want to run. This parameter cannot be used with the -n &quot;&lt;flowchart_name&gt;&quot; parameter.</td>
</tr>
<tr>
<td>-n &quot;&lt;flowchart_name&gt;&quot;</td>
<td>The name of the flowchart that you want to run. Because flowchart names are not necessarily unique, all flowcharts with this name receive the broadcast trigger. This parameter cannot be used with the &lt;campaign_code&gt; parameter.</td>
</tr>
<tr>
<td>&quot;&lt;trigger1&gt;&quot;</td>
<td>The name of the trigger you want to use. You must specify at least one trigger. You can optionally specify multiple triggers, separated by spaces.</td>
</tr>
<tr>
<td>&quot;&lt;trigger2&gt;&quot;</td>
<td>...</td>
</tr>
</tbody>
</table>
Chapter 12. Logging administration

Campaign can provide the following types of logs:

- “The Campaign Listener log”
- “The Campaign web application log”
- “The Campaign Server Manager log” on page 114
- “The Campaign session utility log” on page 114
- “The cleanup utility log” on page 114
- “Flowchart logs” on page 114
- “The sessions log” on page 114
- “The web connections log” on page 114
- “Windows event logs” on page 114 (when the Campaign server is installed on Windows)
- “The log4j log file” on page 115

The Campaign Listener log

The Campaign Listener log file contains events generated by the Campaign Listener.

The log is in the file unica_aclsnr.log, located in the Campaign_home/logs directory.

Depending on the system's logging settings, the Campaign_home/logs directory may contain multiple historical Campaign Listener logs, each ending with an extension number, for example unica_aclsnr.log.1, unica_aclsnr.log.2, and so on.

The number of logs retained and the maximum size of each log depend on the value of the Applications>Campaign>unicaACListener>logMaxBackupIndex and the Applications>Campaign>unicaACListener>logMaxFileSize properties, respectively.

The Campaign web application log

The Campaign web log file contains events generated by the Campaign web application.

The log is in a file called campaignweb.log, located in the Campaign_home/logs directory by default.

Depending on the system's logging settings, the Campaign_home/log directory may contain multiple historical Campaign web application logs, each ending with an extension number, for example campaignweb.log.1, campaignweb.log.2, and so on.

You can configure Campaign web application logging properties in the campaign_log4j.properties file, located in Campaign_home/conf directory by default.
The Campaign Server Manager log

The Campaign Server Manager log file (unica_svradm.log) is generated if an error occurs when running the unica_svradm utility. This log file is located in the Campaign_home/logs directory.

The Campaign session utility log

The Campaign session utility log file (unica_acsesutil.log) is generated if an error occurs when running the unica_acsesutil utility. This log file is located in the Campaign_home/partitions/partition_name/logs directory.

The cleanup utility log

The cleanup utility log file (unica_acclean.log) is generated if an error occurs when running the unica_acclean utility. This log file is located in the Campaign_home/partitions/partition_name/logs directory.

Flowchart logs

Each campaign flowchart generates flowchart-specific logging information when it is run.

The log is in a file called campaign_name__campaign_code__flowchart_name.log. By default, this log file is located in the Campaign_home/partitions/partition_name/logs directory. However, when you are editing a flowchart you can customize the log location by clicking the Options menu and selecting Change Log Path. Note that you cannot select Change Log Path unless AllowCustomLogPath is enabled in the Campaign properties.

The sessions log

When a user views a flowchart, before editing it, session information for that flowchart is logged in the ac_sess.log file, located in the Campaign_home/partitions/partition_name/logs directory.

The ac_sess.log file records information about server connections when flowcharts are opened.

The web connections log

When a user log into Campaign, information is logged in the ac_web.log file, located in the Campaign_home/partitions/partition_name/logs directory.

The ac_web.log file records information about the user’s connections to the Campaign system database.

Windows event logs

When Campaign is installed on a Windows computer, you have the option to log Campaign listener and flowchart events to the Windows event log. Whether the Windows event log is used is determined by the following configuration properties.

- Applications > Campaign > unicaACListener > enableWindows-EventLogging, for the Campaign listener.
Applications > Campaign > partitions >partition_name< server > logging > enableWindowsEventLogging, for flowcharts in that partition.

**The log4j log file**

The Campaign web application uses the Apache log4j utility for logging configuration, debugging, and error information.

**Working with logs**

To work with logs, see the following:
- “Campaign Listener logging tasks”
- “Campaign web application logging tasks”
- “Flowchart logging tasks” on page 116
- “Windows event logging tasks” on page 118

**Campaign Listener logging tasks**

Campaign Listener logging tasks include:
- “To configure Campaign Listener logging”
- “To view the Campaign Listener log file”

**To configure Campaign Listener logging**

Note: To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the *Marketing Platform Administrator’s Guide*.

On the Configuration page, set the following properties in the Campaign > unicaACLListener category as needed. For information on the properties, see the context help or the *Marketing Platform Administrator’s Guide*.
- enableWindowsEventLogging
- loggingLevels
- logMaxBackupIndex
- logMaxFileSize
- windowsEventLoggingLevels

**To view the Campaign Listener log file**

1. Select Settings > Campaign Settings.
   The Campaign Settings page opens, presenting links for various administration tasks.

2. Click View System Log.
   The current Campaign Listener log opens in a new browser window. Events that occur after you open the log file are not listed.

**Campaign web application logging tasks**

Campaign web application logging tasks include:
- “To configure Campaign web application logging” on page 116
- “To change the file name and location of the Campaign web application log” on page 116
To configure Campaign web application logging
1. Locate the file specified by the applications>Campaign>logging> property. By default, the file is Campaign_home/conf/campaign_log4j.properties.
2. Use the comments within this file to change the web application logging settings.
3. Save the file and restart the web application.

To change the file name and location of the Campaign web application log

Note: To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the Marketing Platform Administrator’s Guide.

On the Configuration page, modify the value of the log4jConfig property in the Campaign > logging category to specify location and name for the file used to define the properties of the Campaign web application log.

Flowchart logging tasks
Flowchart logging tasks include:
- “To configure flowchart logging”
- “To enable or disable flowchart logging” on page 117
- “To modify flowchart logging levels” on page 117
- “To customize the flowchart log file location” on page 117
- “To view flowchart log files” on page 118
- “To clear a flowchart log file” on page 118

To configure flowchart logging

Note: To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the Marketing Platform Administrator’s Guide.

On the Configuration page, modify the following properties in the Campaign > partitions > partition[n] > server > logging category as needed. For information on the properties, see the context help or the Marketing Platform Administrator’s Guide.
- allowCustomLogPath
- enableLogging
- enableWindowsEventLogging
- keepFlowchartLogOpen
- logFileBufferSize
- loggingCategories
- loggingLevels
- logMaxBackupIndex
- logMaxFileSize
- logProcessId
- windowsEventLoggingCategories
- windowsEventLoggingLevels
To enable or disable flowchart logging
1. When editing a flowchart, click the Options icon.
2. In the Options menu, examine the Enable Logging command:
   - When this command shows a check mark, logging is enabled.
   - When no check mark appears, logging is disabled.
3. Select Enable Logging to toggle the current setting.

To modify flowchart logging levels
1. When editing a flowchart, select Options > Logging Options.
   The Logging Options window opens.
2. Check the message types to log. In increasing order of verbosity, the four levels of logging are:
   - Error - Flowchart errors.
   - Warning - Flowchart warnings.
   - Information - Informational messages.
   - Debug - Verbose debugging information.
   Log files can grow quickly when informational or debugging messages are logged, so you may want to clear these options unless debugging.
3. Check the message categories to log.
4. Check Include the Process ID in Log Entries to have the process ID included for each entry.
5. Click OK to save the settings.

To customize the flowchart log file location

Before you can customize the log file location, the AllowCustomLogPath configuration property for the Campaign server must be enabled in the Campaign > partitions > partition[n] > server > logging category. See the CampaignAdministrator’s Guide for details on setting configuration properties.

By default, each flowchart log file is stored in the Campaign_home/partitions/ partition_name/logs directory. However, when you are editing a flowchart, you can specify that the flowchart’s log should be stored in a different location.
1. When editing a flowchart, select Tools > Change Log Path.
   The Select Log Path window appears.
   If the Change Log Path option is not enabled, be sure that the server's AllowCustomLogPath configuration property is enabled, then edit the flowchart to try again.
2. Use the Directory list to locate the directory in which you want to store the flowchart log files. Double-click any directory name to see the directories it contains.
3. Optionally, you can create a new directory on the Campaign server by clicking the New Folder icon above the Directory list.
4. When you have selected the directory in the list, click Open to accept your choice. The Select Log Path window closes automatically.

The flowchart’s log files will now be stored in the directory you specified.
To view flowchart log files

When editing a flowchart, select Options > View Logs.

The flowchart log file opens in a new browser window.

To clear a flowchart log file

When editing a flowchart, select Options > Clear Logs.

The content of the log file is deleted.

Windows event logging tasks

Windows event logging tasks include:

- “To configure Windows event logging for the Campaign listener”
- “To configure Windows event logging for flowcharts”

To configure Windows event logging for the Campaign listener

Note: To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the Marketing Platform Administrator’s Guide.

On the Configuration page, set the enableWindowsEventLogging and windowsEventLoggingLevels properties in the applications>Campaign>unicaACListener category as needed. For information on the properties, see the context help or the Marketing Platform Administrator’s Guide.

To configure Windows event logging for flowcharts

Note: To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the Marketing Platform Administrator’s Guide.

On the Configuration page, modify the following properties in the Campaign > partitions > partition[n] > server > logging category as needed:

- enableWindowsEventLogging
- windowsEventLoggingCategories
- windowsEventLoggingLevels

For information on the properties, see the context help or the Marketing Platform Administrator’s Guide.

log4j logging tasks

Using log4j logging in Campaign includes the following tasks:

- “To configure logging in log4j”
- “To change the location of the campaign_log4j.properties file” on page 119

To configure logging in log4j

To configure logging in log4j for IBM Unica Campaign, you set property values in the campaign_log4j.properties file located in the conf directory under your Campaign installation. For example, to change the location of the log file, open the
campaign_log4j.properties file and change the value of the log4j.appender.FILE.File property to the fully qualified path where you want the log file to be written.

For information about changing log4j property settings, see the following sources:

- The comments in the campaign_log4j.properties file.
- The log4j documentation on the Apache web site:
  http://logging.apache.org/log4j/1.2/manual.html

**Note:** After you change values in the campaign_log4j.properties file, you must restart the IBM Unica Campaign web application.

**To change the location of the campaign_log4j.properties file**

On the Configuration page, change the value of the log4jConfig property in the Campaign > logging category to the desired location.
Chapter 13. Unique code administration

Each campaign, offer, treatment, and cell in Campaign has an identifying code that is generated by code generators, and conforms to a specified format.

As a Campaign administrator, you can:
- Set configuration parameters to control how each type of code is generated, and valid formats for codes.
- Create and set up a custom code generator if the default generators do not meet your needs.

About campaign codes

A campaign code is the globally unique identifier for a campaign. Each campaign must have a code, and no two campaign codes in the same Campaign partition can be the same.

Note: Note that although campaign codes must be unique within each partition, campaign names do not need to be unique.

When users create a campaign, the Campaign Code field is automatically populated with a unique value from the code generator.

Users can click Regenerate code to have the code generator supply a new identifier, or they can enter a code manually. If users manually enter a code, it must be unique and in the specified format.

About offer codes

An offer code is the globally unique identifier for an offer. Each offer in Campaign must have a code, and no two offer codes in the same Campaign partition should be the same.

An offer code can have one to five parts, which you specify when creating the offer template.

When users create an offer, the Offer Code field(s) are automatically populated with a unique value from the code generator.

Users can click Regenerate code to have the code generator supply a new identifier, or they can enter a code manually. To override offer codes, users must have the appropriate permission.

Important: Automatically generated offer codes are guaranteed to be globally unique only if no user ever overrides any offer code.

About cell codes

A cell code is an identifier for each cell in a flowchart or in the target cell spreadsheet.
In the flowchart processes that create new output cells (for example, Select, Merge, Segment, Sample, Audience and Extract processes), cell code(s) for the output of the process are configured in the **General** tab.

By default, the cell code is generated automatically; users can manually override the generated cell code by clearing the **Auto Generate** checkbox and entering a code in the valid format.

Whether cell codes must be unique within a flowchart depends on the setting of the `AllowDuplicateCellCodes` configuration parameter (described in Code generation references). If the value of `AllowDuplicateCellCodes` is **No**, cell codes must be unique within a flowchart; the same cell code can still exist in different flowcharts and campaigns. If the value of `AllowDuplicateCellCodes` is **Yes**, cell codes within a single flowchart do not have to be unique.

If duplicate cell codes are not allowed and a user enters a cell code that is already used elsewhere in the same flowchart, no error is immediately generated. However, users can validate flowcharts and detect duplicate cell codes using the flowchart validation tool if duplicate cell codes are not allowed. For information on flowchart validation, see the section on Validating Flowcharts in the **Campaign User’s Guide**.

**Important:** Automatically generated cell codes are guaranteed to be unique only if no user ever overrides any cell code. For more information about working with cells, see the **Campaign User’s Guide**.

---

**About treatment codes**

The unique combination of a cell and an offer used at a particular point in time is referred to in Campaign as a treatment. Each treatment is uniquely identified with a treatment code.

For more information about treatments, see the **Campaign User’s Guide**.

Separate treatments, and treatment codes, are generated each time a flowchart is run. If users run a flowchart on January 1, and again on January 15, two separate treatments are created. This allows you to track responses to offers in the most granular way possible.

**Note:** Once treatment codes are generated, they cannot be overridden.

---

**Code formats**

The default and valid format for each type of generated code uses a series of characters to represent the character types. The following table lists the characters you can use to control code formats.

**Table 32. Control code formats**

<table>
<thead>
<tr>
<th>Characters</th>
<th>Treated As</th>
</tr>
</thead>
<tbody>
<tr>
<td>A-Z, any symbol, b, d-m, o-w, y, z (or, b-z except c, n, x)</td>
<td>A constant value in the generated code</td>
</tr>
<tr>
<td>a</td>
<td>Any uppercase letter A-Z</td>
</tr>
</tbody>
</table>

---
Table 32. Control code formats (continued)

<table>
<thead>
<tr>
<th>Characters</th>
<th>Treated As</th>
</tr>
</thead>
<tbody>
<tr>
<td>c or x</td>
<td>Any uppercase letter A-Z, or any number, 0-9</td>
</tr>
<tr>
<td>x</td>
<td>Any uppercase letter A-Z, any number 0-9. However, users can replace the generated character with any ASCII character.</td>
</tr>
<tr>
<td></td>
<td>To specify variable length codes, the code format must end with one or more &quot;x&quot; characters, and the allowVariableLengthCodes property must be set to &quot;yes&quot;.</td>
</tr>
<tr>
<td>n</td>
<td>Any number 0-9</td>
</tr>
</tbody>
</table>

Example

Table 33. Example of control code format

<table>
<thead>
<tr>
<th>Format definition</th>
<th>Example of generated code</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAMP_aaannn</td>
<td>CAMP_DWP839</td>
</tr>
<tr>
<td></td>
<td>(CAMP_, followed by three randomly generated capital letters, then three randomly generated numeric digits)</td>
</tr>
</tbody>
</table>

Default code formats

The following table shows the default formats for campaign, cell, offer and treatment codes generated by Campaign’s built-in code generators:

Table 34. Default code formats

<table>
<thead>
<tr>
<th>Code type</th>
<th>Default Value</th>
<th>Where Defined</th>
</tr>
</thead>
<tbody>
<tr>
<td>Campaign</td>
<td>Cnnnnnnnnnn</td>
<td>campCodeFormat parameter on the Marketing Platform Configuration page</td>
</tr>
<tr>
<td>Cell</td>
<td>Annnnnnnnn</td>
<td>cellCodeFormat parameter on the Marketing Platform Configuration page</td>
</tr>
<tr>
<td>Offer</td>
<td>nnnnnnnnnn</td>
<td>In each offer template defined in Campaign</td>
</tr>
<tr>
<td>Treatment</td>
<td>nnnnnnnnnn</td>
<td>In each offer template defined in Campaign</td>
</tr>
</tbody>
</table>

Code format requirements

Unique campaign, cell, treatment, and offer codes must be 32 characters or less. This applies to codes generated by both default and custom code generators as well as any manually entered codes.

In offer codes, you cannot use the space character.

About changing the default code formats

You can override the default formats for the codes generated by Campaign’s built-in code generators.
Before modifying the default code formats, be aware of code format restrictions in Campaign.

**To change the campaign code format**

**Note:** To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the *Marketing Platform Administrator's Guide*.

When you change campaign code format, the new format applies to all new campaigns. Existing campaigns can continue to use their current codes in the previous format. However, if a user edits the campaign code, the new code must adhere to the current campaign code format.

On the Configuration page, set the `campCodeFormat` property in the `Campaign > partitions > partition[n] > server > systemCodes` category as required. Follow the formatting guidelines as described in “Code formats” on page 122.

**To change the cell code format**

**Note:** To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the *Marketing Platform Administrator's Guide*.

**Important:** Do not change the cell code format after users have created flowcharts. Doing so will invalidate existing flowcharts.

On the Configuration page, set the `cellCodeFormat` property in the `Campaign > partitions > partition[n] > server > systemCodes` category as required. Follow the formatting guidelines as described in “Code formats” on page 122.

**To change the offer or treatment code format in an existing offer template**

You define the offer and treatment code formats for each offer template you create. You set the offer or treatment code formats at the time that you create each offer template. You can also change the offer and treatment code formats for existing offer templates by editing the template, but only if the template has not yet been used to create offers.

**Note:** You can change the offer and treatment code formats in existing offer templates only if the template has not yet been used to create offers.

1. Log in to Campaign and click **Administration**.
2. On the Campaign Settings page, click **Offer Template Definitions**.
3. Click the link for the offer template whose offer or treatment code format you want to change.
4. On offer template definition page, modify the Offer Code Format or Treatment Code Format as required, following the formatting requirements in Code format requirements.

**Important:** You cannot use the space character in an offer code format.

5. Click **Finish**.
About code configuration properties

All properties for configuring campaign and cell codes, code generators, and certain attributes of offer codes in Campaign are set on the Marketing Platform Configuration page.

Offer code formats are defined in offer templates rather than configured using parameters.

About code generators

Code generators are the programs used to automatically generate campaign, cell, offer, and treatment codes of the required format in Campaign. In addition to its built-in code generators, Campaign supports custom code generators that you develop.

Default code generators in Campaign

Campaign provides code generators that automatically generate campaign, cell, offer, and treatment codes matching the default specified format for each type of code. The following table shows the name tof each type of code's built-in code generator and its location:

<table>
<thead>
<tr>
<th>Code Type</th>
<th>Default Generator</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Campaign</td>
<td>uaccampcodegen</td>
<td>&lt;install_dir&gt;/Campaign/bin</td>
</tr>
<tr>
<td>Cell</td>
<td>uaccampcodegen</td>
<td>&lt;install_dir&gt;/Campaign/bin</td>
</tr>
<tr>
<td>Offer</td>
<td>uacoffercodegen</td>
<td>&lt;install_dir&gt;/Campaign/bin</td>
</tr>
<tr>
<td>Treatment</td>
<td>uaccampcodegen</td>
<td>&lt;install_dir&gt;/Campaign/bin</td>
</tr>
</tbody>
</table>

Replace <install_dir> with the actual directory in which Campaign is installed.

If the code generators built-in to Campaign do not meet your company’s needs, you can develop and use custom code generators.

About custom code generators

If Campaign’s default code generators do not meet your needs, you can develop and use your own code generators. A custom code generator is any program you develop to output unique campaign, offer, or cell codes (or all three). You can develop a custom code generator in any programming language that can be compiled into an executable file for the operating system on which the Campaign web application is deployed.

Important: If the Campaign web and analytical servers are deployed on separate machines, make sure you deploy the code generators on all machines.

The most common reason for creating a custom code generator is to generate codes that are useful for your company’s business needs. For example, your custom code generator could be set up to create campaign codes containing the campaign owner’s initials and the current date.
Requirements for custom code generators

Custom code generators must meet the following requirements:
- The executable name must be a single word with no spaces;
- The unique codes generated must match the specified code format, which is passed as an input to the custom code generator;
- The custom code generators must output the unique codes, or an error, to the standard output stream (stdout);
- Custom campaign and cell code generators must be placed in the /Campaign/bin directory. Custom offer code generators can be placed in a location of your choice which you then must specify in the offer code generator configuration properties on the Marketing Platform Configuration page.

About configuring Campaign to use custom code generators

You specify campaign and cell code formats and generators using a property on the Marketing Platform Configuration page.

Note: To complete this task, you must have the appropriate permissions in IBM Unica Marketing. For information, see the Marketing Platform Administrator’s Guide.

You specify the offer and treatment code generators for each offer template you create. Each offer created based on a template then uses the program(s) you specify to generate unique offer and treatment codes.

To specify the campaign code generator

Note: To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the Marketing Platform Administrator’s Guide.

On the configuration page, set the value of the campCodeGenProgFile property in the Campaign > partitions > partition[n] > server > systemCodes category to the executable name of the custom campaign code generator.

To specify the cell code generator

Note: To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the Marketing Platform Administrator’s Guide.

On the Configuration page, set the value of the cellCodeGenProgFile property in the Campaign > partitions > partition[n] > server > systemCodes category to the executable name of the custom campaign code generator.

To specify the offer code generator

1. Log in to Campaign and click Administration.
2. On the Campaign Settings page, click Offer Template Definitions.
3. Click the link for the offer template whose offer code generator you want to specify.
4. On Step 1 of the new offer template definition page, enter the executable name of the custom offer code generator as the value of the Offer Code Generator field.
5. Click Finish.
To specify the treatment code generator
1. Log in to Campaign and click Administration.
2. On the Campaign Settings page, click Offer Template Definitions.
3. Click the link for the offer template whose offer code generator you want to specify.
4. On the Step 1 offer template definition page, enter the executable name of the custom treatment code generator as the value of the Treatment Code Generator field. If you leave this field empty, the default treatment code generator is used.
5. Click Finish.

About creating custom code generators
You can create custom code generators in any language that can be compiled into an executable file for the operating system on which you are running Campaign.

About outputting unique codes
The custom code generator must output unique codes, of no more than 32 characters, to the standard output stream (stdout).

Important: When Campaign saves offer and cell codes, it does not check their uniqueness. You must ensure that any custom code generators you use can generate globally unique codes (assuming no users override generated codes).

The output line must:
• Start with 1,
• Followed by one or more blank spaces,
• Followed by the unique code, within double quotation marks.

Example
The following example shows the correct code output format:

1 "unique_code"

About outputting errors
The custom code generator must output an error to the standard output stream (stdout) when it is not able to properly generate a unique code of the proper format.

The output line for the error must:
• Start with 0,
• Followed by one or more blank spaces,
• Followed by the error message, within double quotation marks.

Example
The following example shows the correct code output format:

0 "error_message"
Note: The error message generated by the custom code generator is displayed to the user and written to the log.

About placing the custom code generators
You must place the application that generates campaign or cell codes in the bindirectory of your Campaign installation.

You can place custom offer code generators in a location of your choice, then specify the location using IBM Unica Marketing.

To specify the location of the custom offer code generator

Note: To complete this task, you must have appropriate permissions to use Marketing Platform. For information, see the Marketing Platform Administrator’s Guide.

On the Configuration page, change the value of the offerCodeGeneratorConfigString property in the Campaign > partitions > partition_N > offerCodeGenerator category to the location of the custom offer code generator executable. The location is relative to the Campaign web application home.

Code generation references

This section contains the following reference topics:
- “Properties related to code generation”
- “Parameters for the default campaign and cell code generators” on page 129
- “Parameters for the default offer code generator” on page 129
- “Parameters for custom code generators” on page 130

Properties related to code generation

Use the following properties to customize code formats and generators. To access and modify these properties, use the Marketing Platform Configuration page. For information about these properties, see the context help or the Marketing Platform Administrator’s Guide.

Table 36. Properties to customize code formats and generators

Parameters for the default campaign and cell code generators

The following parameters are supported by the uaccampcodegen program, located in the `<Campaign_home>/bin` directory (where `<Campaign_home>` is the Campaign installation directory, such as `C:\Unica\Campaign\bin`, or `/Unica/Campaign/bin`).

Table 37. Parameters for default campaign and cell code generators

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>-c</td>
<td>Passes in the cell name.</td>
</tr>
<tr>
<td>-d</td>
<td>Passes in the day. Can accept one or two integers, not to exceed the value of 31.</td>
</tr>
<tr>
<td>-f</td>
<td>Passes in the code format, used to override the default format.</td>
</tr>
<tr>
<td>-i</td>
<td>Passes in an additional integer to be used to generate a unique code.</td>
</tr>
<tr>
<td>-m</td>
<td>Passes in the month. Can accept one or two integers, from 1 - 12.</td>
</tr>
<tr>
<td>-n</td>
<td>Passes in the campaign name.</td>
</tr>
<tr>
<td>-o</td>
<td>Passes in the campaign owner.</td>
</tr>
<tr>
<td>-s</td>
<td>Passes in an additional string to be used to generate a unique code.</td>
</tr>
<tr>
<td>-u</td>
<td>Passes in the campaign ID, to use instead of the system generated ID.</td>
</tr>
<tr>
<td>-v</td>
<td>Prints the first argument to the standard output stream (STOUT).</td>
</tr>
<tr>
<td>-y</td>
<td>Passes in the year. Accepts four integers.</td>
</tr>
</tbody>
</table>

Parameters for the default offer code generator

The following parameters are supported by the uacoffercodegen program, located in the `<Campaign_home>/bin` directory (where `<Campaign_home>` is the Campaign installation directory).

Table 38. Parameters for default offer code generator

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>-a</td>
<td>Passes in the number of offer code parts, from 1 - 5.</td>
</tr>
</tbody>
</table>

<td>Passes in an additional string to be used to generate a unique code.</td>
</tr>
<tr>
<td>-u</td>
<td>Passes in the campaign ID, to use instead of the system generated ID.</td>
</tr>
<tr>
<td>-v</td>
<td>Prints the first argument to the standard out stream (STOUT).</td>
</tr>
<tr>
<td>-y</td>
<td>Passes in the year. Accepts four integers.</td>
</tr>
</tbody>
</table>

Example

```
uacoffercodegen -f "nnnnnnnn nnnnnnnnn nnnnnnnnn nnnnnnnnn nnnnnnnnnnnnnnnnnn"
         -a 5 -u 3 -y 2008 -m 1 -d 14
```

Parameters for custom code generators

Campaign supports custom parameters as input to any custom code generator you configure for use in Campaign.

No validation is performed for these parameters; however, the following restrictions apply:

- You cannot reuse the flags for the default Campaign code generators as flags for parameters in the custom code generators.
- Do not use spaces in custom code generator executable names.
- Do not use double quotation marks around parameters or around the executable name.
- Spaces are read as separators between the code generator executable name, and between parameters. The first space is interpreted as marking the end of the executable name; subsequent spaces are interpreted as separating multiple parameters.
- The code generator fields for the Configuration Manager and the offer template interface are limited to 200 characters.
Chapter 14. Advanced settings administration

You use advanced settings to manage some Campaign settings and server optimization features.

To access Advanced settings

1. Open a flowchart in Edit mode.
2. Click the Admin icon and select Advanced Settings.
   The Advanced Settings window opens.
   The Advanced Settings window has three tabs:
   • General
   • Server Optimization
   • Test Run Settings

About the General settings

The General tab settings allow you to specify:
• Whether results from runs of this flowchart are saved;
• Whether flowchart processing is done “in database” or on the Campaign server;
• Whether global suppression is disabled for this flowchart;
• The Y2K (Year 2000) threshold;
• Whether Campaign automatically saves this flowchart;
• Whether Campaign uses checkpoints during runs of this flowchart;
• The maximum number of data errors Campaign allows;
• The triggers to send if a run of this flowchart results in an error;
• The triggers to send if a run of this flowchart completes successfully.

Save flowchart run results

Select this checkbox to specify that all output cells from flowchart runs are saved when the run is finished. If you save results, next time you open the flowchart you will be able to profile the results of any process that has finished running, or start a process or branch run from the middle of a flowchart. If you do not save results, each time you want to view results of a flowchart run you will have to re-run the entire flowchart from the beginning.

By default, this checkbox is selected.

Use in-DB optimization during flowchart run

Select this checkbox to specify that you want Campaign to operate in the database as much as possible when running flowcharts, rather than on the Unica server. Advantages of “in-database” processing are that data does not have to be pulled from the database to the Unica server after each process runs. By default, this checkbox is cleared.

For more details about in-database optimization, see the Campaign User’s Guide.
Disable global suppression for this flowchart

Select this checkbox to disable global suppression for this flowchart.

**Note:** If you do not have the appropriate permissions, you cannot change the setting and must run the flowchart with the existing setting. By default, new flowcharts are created with this setting cleared, and global suppressions applied.

Y2K threshold

The **Y2K Threshold** value determines how Campaign interprets years that are represented with only two digits.

**Note:** We highly recommend that you store dates in the database with 4-digit years to prevent confusion.

Valid values are 0 to 100; any values higher than 100 are set to 100. The default setting for Y2K Threshold is 20.

Campaign uses the Threshold value to calculate a range of years whose lower limit is the threshold value + 1900 and whose higher limit is 99 years above that.

For example, if you set the Y2K Threshold to 50, the range of years is from 1900+50 = 1950, to 99 years above that, that is, 2049.

So, if you enter a two-digit year greater than or equal to your threshold (in this case, 50), the date is interpreted to be in the 1900s. If you enter a two-digit year less than your threshold, it is interpreted to be in the 2000s.

If you sent the Y2K Threshold to the maximum value of 100, the range of years will be 1900+100 = 2000, to 2099. In this case, all two-digit years are interpreted to be in the 2000s.

You can change this threshold as needed.

Auto-save

You can set the auto-save feature to automatically save your work periodically (for example, every 5 minutes) for recovery purposes. If the Campaign server terminates while you are editing a flowchart, if you had Auto-Save enabled, when you re-open the flowchart, you will see the last auto-saved version.

**Note:** You must have previously saved the current flowchart (provided a file name) for this feature to work.

Campaign stores auto-save files in a temporary directory so that the original flowchart files are not changed. Therefore, in non-recovery situations (for example, if you manually exit flowchart Edit mode without saving your flowchart) auto-saved versions are not retrieved. In this situation, when you re-open a flowchart that you manually left without saving, you will see the last manually saved version.

Auto-save never saves flowcharts that are in a paused state, even if Auto-save occurs while a selected process is running.
The default setting for Auto-Save is *Never*.

**Checkpoint**

The Checkpoint feature provides the ability to capture a “snapshot” of a running flowchart for recovery purposes. A checkpoint “save” has the same effect as if you selected *File > Save*, and allows you to recover a flowchart in the state of the most recent checkpoint save, in the event the server stops or goes down.

When you set a frequency interval for checkpoint, it controls a timer on the server for a running flowchart. Checkpoint saves are made at the specified intervals.

Checkpoint is active during a flowchart run and when you run a branch in the *Flowchart*. When the running flowchart saves, Campaign saves it in Paused mode. When you open the flowchart, you must either stop or resume the flowchart. When you resume, the currently executing processes run again from the beginning.

The default setting for Checkpoint is *Never*.

**Maximum data errors allowed**

When Campaign exports data to a file or a mapped table (for example, in a *Snapshot* or *Optimize* process), it occasionally encounters an error in format (for example, data does not fit into the table). The *Maximum Data Errors Allowed* option allows Campaign to continue working on the file (if less than N number of errors occur) instead of failing on the first error.

The default is zero (0) errors.

**Note:** Set this value higher if you are debugging a problem with an export and want to write the errors to a log file.

**Send trigger on flowchart run errors**

This option allows you to select one or more triggers from a list of outbound triggers that run when a campaign encounters errors during a flowchart run (indicated by a red X). You most commonly use this option to trigger an email to alert an administrator of the problem. Trigger on Failure runs for each process run that fails.

**Send trigger on flowchart success**

This option allows you to select one or more triggers from a list of outbound triggers that run when a session succeeds. You most commonly use this option to trigger an email to alert an administrator of the successful run. Trigger on Success runs only if the entire flowchart run completes successfully.

**About the Server Optimization settings**

The *Server Optimization* tab allows you to specify the Campaign *Virtual Memory Usage Limit* and override use of temporary tables for the current flowchart.
Unica Virtual Memory Usage

Unica Virtual Memory Usage allows you to specify the maximum number of megabytes of system virtual memory to use for executing a specific flowchart. You can raise the value to increase performance or decrease this value to limit the resources used by a single flowchart.

The default setting is 32 MB, but you can change the setting to suit your server’s capabilities and your needs.

**Note:** Set a value equal to (80% x available memory) / (number of expected concurrent Campaign flowcharts).

Disallow use of temporary tables for this flowchart

The **Disallow Use of Temp Tables for This Flowchart** checkbox allows you to specify that temporary tables should not be used for the current flowchart. This overrides the allow_temp_tables property in the central configuration repository provided by IBM Unica Marketing.

About the Test Run Settings

The **Test Run Settings** tab allows you to specify whether to write test run results to your database.

Select the **Enable Output** checkbox to specify that you want to output the results of your test runs to your database.

In general, Campaign does not write test run results to your database; however, you might want to verify that results are being recorded properly. To do this, limit your cell size and then select the **Enable Output** checkbox, so that you are using a limited amount of data to test your flowchart run and its output.
Chapter 15. IBM Unica Campaign utilities

This section describes the administrative utilities available with Campaign.

**Campaign Listener (unica_aclsnr)**

The Campaign listener, also referred to as the Campaign server, is a utility (unica_aclsnr) that allows clients to connect to the Campaign web application. The Campaign listener must be running, in addition to the web application server in which Campaign is deployed and running, before users who log in to the IBM Unica Marketing can work with any Campaign features.

You can start and stop the listener manually or automatically.

To have the Campaign server start automatically with the system on which Campaign is running:

- If Campaign is installed on a Windows server, you can set up the listener as a service. See “To install the Campaign server as a Windows service” on page 136 for details.
- If Campaign is installed on a UNIX server, set up the listener as part of the init process. See your UNIX distribution’s documentation for information about setting up the init process.

**Campaign listener requirements**

The Campaign listener requires that Marketing Platform be running. The listener connects to Marketing Platform using the value of the configurationServerBaseUrl property in the config.xml file, located in the conf directory of your Marketing Platform installation. Typically, this value is http://hostname:7001/Unica. If Marketing Platform is not running, the Campaign listener will fail to start.

As the listener is dependent on Marketing Platform to start successfully, you should ensure that your web application server is running and the Marketing Platform web application is deployed before starting the listener.

**Campaign listener syntax**

The unica_aclsnr utility has the following syntax:

```
unica_aclsnr [-i] {[-n] | [-r]} [-u] [-v]
```

**Campaign listener options**

The unica_aclsnr utility supports the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-i</td>
<td>This option installs the listener utility as a service (Windows only).</td>
</tr>
<tr>
<td>-n</td>
<td>This option is the opposite of -r. It prevents the listener from checking the unica_aclsnr.udb file.</td>
</tr>
</tbody>
</table>
Table 39. Campaign listener options (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-r (the default)</td>
<td>This option starts a recovery run by forcing the listener to find and register any running flowcharts. Use this parameter if for some reason the listener goes down and you have flowcharts (that is, ac5vr processes) still running. The listener stores flowchart information in a text file (unica_acslnr.udb). When you use the -r option, the listener checks the file for running flowcharts and re-establishes the connections. Even if the running flowchart processes (flowchart and branch production runs only) went down with the listener, the listener reloads those flowcharts and resumes running them from the last saved checkpoints.</td>
</tr>
<tr>
<td>-u</td>
<td>This option uninstalls the listener utility as a service (Windows only).</td>
</tr>
<tr>
<td>-v</td>
<td>This option displays the current version of the listener.</td>
</tr>
</tbody>
</table>

Starting and stopping the listener

If you have set up the listener as a service (on Windows) or as part of the init process (on UNIX) then the listener is automatically started when you start the server.

You can also start and stop the listener manually, as described in this section.

To start the Campaign listener on a Windows system

To start the Campaign listener on a supported Windows system:
1. Make sure that the web application server on which Campaign is deployed is up and running.
2. Start the Campaign listener by running the cmpServer.bat script located in the bin directory under your Campaign installation.

When the unica_acslnr.exe process appears on the Windows Task Manager Processes tab, the server has started successfully.

To stop the Campaign listener on a Windows system

To stop the Campaign listener on a supported Windows system:
1. Enter the following command at the system prompt: svrstop -p 4664
2. At the Login prompt, enter the user name of a Campaign user.
3. At the Password prompt, enter the password for the Campaign user you have entered.

The Campaign listener process closes. Note that when the listener is not running, users who connect to the IBM Unica Marketing will not be able to open any Campaign features.

To install the Campaign server as a Windows service

To install the Campaign server (also referred to as the Campaign listener) as a Windows service that starts automatically whenever the Windows system starts:
1. Add the bin directory under your Campaign installation to the user PATH environment variable. If the PATH environment variable does not exist for the user, create it.
Make sure you add this path to the user PATH variable, not the system PATH variable.

If the Campaign bin directory exists in the system PATH environment variable, remove it. You do not need it in the system PATH environment variable to install the Campaign server as a service.

2. If you are upgrading from a previous version of Campaign that had the server installed as a service, stop the service.

3. Open a command window and change directories to the bin directory under your Campaign installation.

4. Run the following command to create the Campaign server service:
   
   unica_aclsrrr -i
   
   The service is created.

   Note: Make sure CAMPAIGN_HOME has been created as a system environment variable before starting the Campaign server service.

To start the listener on UNIX systems

Enter the following command at the system prompt:

rc.unica_ac start

To stop the listener on UNIX systems

Enter the following command at the system prompt:

rc.unica_ac stop

Campaign listener log

The listener process creates a log file called unica_aclsrrr.log.

Campaign Listener Shutdown utility (svrstop)

Use the Campaign listener shutdown utility (svrstop) to perform the following tasks:

- Shut down the Campaign listener
- Shut down the Optimize listener

   Note that the best practice is to start up and shut down the Optimize listener using the ACOSServer script, which uses the svrstop utility. See the IBM Unica Optimize Installation Guide for details.

   Note: The Listener Shutdown utility can be used as a standalone command to stop the specified listener, or in a script if you also include the necessary authentication arguments.

Campaign srvstop utility reference

Use the svrstop utility to stop the Campaign listener or the Optimize listener, running on your local server or a server elsewhere on your network, for which you have the proper credentials.
The svrstop utility is installed automatically on every Campaign server in the `<install_dir>/Campaign/bin` directory, where `<install_dir>` is the parent IBM Unica directory in which Campaign is installed.

The `svrstop` utility uses the following syntax:

```
```

Each argument is described in the following table:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-g</code></td>
<td>Pings the specified server to determine whether the listener is active.</td>
</tr>
<tr>
<td><code>-p &lt;port&gt;</code></td>
<td>The port on which the listener is running. Set <code>&lt;port&gt;</code> to 4664 to shut down the Campaign listener. Set <code>&lt;port&gt;</code> to 2882 to shut down the Optimize listener.</td>
</tr>
<tr>
<td><code>-S</code></td>
<td>Specifies that the listener specified by the <code>-p</code> or <code>-P</code> argument is using SSL.</td>
</tr>
<tr>
<td><code>-s &lt;servername&gt;</code></td>
<td>The host name of the server on which the listener is running, such as optimizeServer or campainServer.example.com. If you omit this argument, the utility attempts to shut down the specified listener on your local server.</td>
</tr>
<tr>
<td><code>-y &lt;user&gt;</code></td>
<td>The IBM Unica Marketing user with Campaign administrator privileges to shut down the specified listener. If you omit this value, you will be prompted for a user when you run the utility.</td>
</tr>
<tr>
<td><code>-z &lt;password&gt;</code></td>
<td>The password for the IBM Unica Marketing user you specified with the <code>-y</code> argument. If you omit this value, you will be prompted for a password when you run the utility.</td>
</tr>
<tr>
<td><code>-v</code></td>
<td>Reports the version information for the <code>svrstop</code> utility and exits without further actions.</td>
</tr>
<tr>
<td><code>-P &lt;product&gt;</code></td>
<td>The product whose listener you want to shut down. Set this to &quot;Optimize&quot; to shut down the Optimize listener. Any other value for this argument, or omitting this argument, shuts down the Campaign listener.</td>
</tr>
</tbody>
</table>

`svrstop -y asm_admin -z password -p 4664`

**To use the svrstop utility to shut down the Campaign listener**

From a command prompt on the Campaign server, you can run the `svrstop` utility to stop the Campaign listener running on that server. To stop the Campaign listener running on another server, use the `-s` argument, as in `-s servername.example.com`, and provide the required authentication.

1. Open a command prompt on the Campaign server.
2. Make sure that the `CAMPAIGN_HOME` environment variable is set to `<install_dir>/Campaign/bin`, where `<install_dir>` is the parent directory under which Campaign is installed.
3. Enter the following command:
   
   `svrstop -p 4664`
The -p argument specifies the port on which the listener is accepting connections. Port 4664 is the port that Campaign uses internally to accept connections from the web client, so the -p 4664 argument indicates you are stopping the Campaign listener.

4. When prompted, provide the name and password of any IBM Unica Marketing user with privileges to stop the listener.

   Optionally, you could include -y <username> and -z <password> as arguments with the svrstop> command to prevent the user name and password prompts from appearing.

When you enter the required information, the Campaign listener is shut down.

**To use the svrstop utility to shut down the Optimize listener**

From a command prompt on the Campaign server, you can run the svrstop utility to stop the Optimize listener running on that server. To stop the Optimize listener running on another server, use the -s argument, as in -s servername.example.com, and provide the required authentication.

1. Open a command prompt on the Campaign server.
2. Make sure that the CAMPAIGN_HOME environment variable is set to <install_dir>/Campaign/bin, where <install_dir> is the parent directory under which Campaign is installed.
3. Enter the following command:
   ```
   svrstop -P "Optimize"
   ```
   The -P argument specifies the product whose listener you want to shut down. Alternatively, you could enter -p 2882 to shut down the listener using the internal port number 2882, which would also indicate the Optimize listener.
4. When prompted, provide the name and password of any IBM Unica Marketing user with privileges to stop the listener.

   Optionally, you could include -y <username> and -z <password> as arguments with the svrstop> command to prevent the user name and password prompts from appearing.

When you enter the required information, the Optimize listener is shut down.

**Campaign Server Manager (unica_svradm)**

The Campaign Server Manager (unica_svradm) is a command-line server management utility that allows you to perform the following tasks:

- Connect to the Campaign listener
- View all currently open flowcharts and their states
- View and set environment variables
- Run flowcharts
- Suspend/resume flowcharts
- Stop flowcharts
- Kill runaway flowcharts

When you start the unica_svradm utility, it checks whether the listener is running.

If the listener is running, the connection automatically establishes and the names of the server and the port number are displayed.
To run the Campaign Server Manager

Before you can run the Campaign Server Manager:

- The listener must be running.
- The UNICA_PLATFORM_HOME and CAMPAIGN_HOME environment variables must be set for the command window you are using.
- Your IBM Unica Marketing login must have the Run Svradm cmdline permission.

1. At a command prompt, enter:
   
   `unica_svradm -s listener_server -y Unica_Marketing_username -z Unica_Marketing_password`

2. At the following prompt:
   
   `unica_svradm[server:port]>
   issue the commands described in “Campaign Server Manager commands.”

Campaign Server Manager commands

The Campaign Server Manager supports the commands described in the following section. To view the list of all available commands for unica_svradm, use the `Help` command.

Note: Commands that take a flowchart name as an argument will operate on all flowcharts in all campaigns and sessions that have the same name. Use relative flowchart paths for commands that take flowchart paths.

The Campaign Server Manager commands are not case-sensitive.

Cap (Distributed Marketing)

Cap

The Cap command prevents additional Distributed Marketing flowcharts from starting, while allowing those currently running to complete. Unset with the uncap command.

Changeowner

Changeowner -o <olduserid> -n <newuserid> -p <policyid>

The Changeowner command allows you to change the owner of a user's campaigns. You might use this command, for example, if you are deleting or disabling a user and want to re-assign ownership of that user's campaigns to a new user.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-o &lt;olduserid&gt;</td>
<td>User ID of the current owner of the campaign.</td>
</tr>
<tr>
<td>-n &lt;newuserid&gt;</td>
<td>User ID of the new owner you want to assign to the campaign.</td>
</tr>
<tr>
<td>-p &lt;policyid&gt;</td>
<td>Policy ID of the security policy to apply to the campaign.</td>
</tr>
</tbody>
</table>
**Connect**

`Connect[-f] [-s server] [-p port]`

The `Connect` command connects to the listener running on the `server` at `port` number. You can be connected to only one server at a time. To connect to another server, use `-f` (forced) connection.

**Disconnect**

`Disconnect`

The `Disconnect` command disconnects from the server. This command is available only if you are connected to a server.

**Note:** To connect to another server, you can use the `-f` parameter, or disconnect first, and then connect to the new server.

**Exit**

`Exit`

The `Exit` command logs you out of the Campaign Server Manager.

**Help**

`Help`

The `Help` command displays the available commands.

**Kill**

`Kill -p pid`

The `Kill` command issues a "kill-p" to the `pid` specified (the Windows NT equivalent is issued on Windows NT). This is intended for run-away processes.

**Loglevel**

`Loglevel [high | low | medium | all]`

The `Loglevel` command sets the listener logging level for Campaign or, if you enter the command without any arguments, displays the current logging level. If you modify the logging level, the change takes effect immediately, so there is no need to restart the listener after entering this command.

**Quit**

`Quit`

The `Quit` command logs you out of the Campaign Server Manager.

**Resume**

`Resume {-s flowchart_name | -p pid | -a}`

The `Resume` command resumes the running of one or more flowcharts.
• Use `-s` to resume a single, specific flowchart by name
• Use `-p` to resume the specified process ID
• Use `-a` to resume all suspended flowcharts

**Run**

Run `-p relative-path-from-partition-root -u Unica_Marketing_Platform_user_name [-h partition] [-c catalogFile] [-s] [-m]`

The `Run` command opens and runs a specific single flowchart file, where relative flowchart path and file name, partition, catalog file and user name are given.

You can use the following syntax:

`[-S dataSource -U db_User -P db_Password]*`

**Note:** On Unix platforms, flowcharts will be executed by the Unix account specified as the username’s alternate login. On Windows NT, the flowchart is run as the administrator’s user login.

**Options for the Run command**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-h</code></td>
<td>Specifies the partition name</td>
</tr>
<tr>
<td><code>-l</code></td>
<td>Indicates an alternative location in which to store the process log file. This option should be followed by a path relative to the Campaign installation, as in <code>\partition\logs</code>. Do not specify a file name with this option, because the file name is assigned automatically. <strong>Note:</strong> Using this option also requires that the AllowCustomLogPath configuration property in the Campaign &gt; partitions &gt; partition[n] &gt; server &gt; logging category is enabled. See the Marketing Platform Administrator’s Guide for details on setting configuration properties.</td>
</tr>
<tr>
<td><code>-m</code></td>
<td>Specifies that you are running multiple flowcharts. This option is not supported for batch flowcharts.</td>
</tr>
<tr>
<td><code>-p</code></td>
<td>Specifies the relative path from the partition root</td>
</tr>
<tr>
<td><code>-P</code></td>
<td>Specifies the data source password</td>
</tr>
<tr>
<td><code>-s</code></td>
<td>Specifies a synchronous run</td>
</tr>
<tr>
<td><code>-S</code></td>
<td>Specifies the data source</td>
</tr>
<tr>
<td><code>-u</code></td>
<td>Specifies the IBM Unica Marketing user name</td>
</tr>
<tr>
<td><code>-U</code></td>
<td>Specifies the data source user name</td>
</tr>
<tr>
<td><code>-v</code></td>
<td>Specifies the user variable values for a flowchart directly in the command, using this syntax: <code>[-v &quot;varname=['value']&quot;]*</code></td>
</tr>
<tr>
<td><code>-x</code></td>
<td>Specifies the user variable values for a flowchart in an XML file, using this syntax: <code>[-x xml-filename]</code></td>
</tr>
</tbody>
</table>

**Example of XML file for `-x` argument**

This sample XML file sets the user variable named `UVAcctType` to the value `Gold`. 

142 IBM Unica Campaign: Administrator's Guide
Note: Campaign sets the user variable's value exactly as written in this file. Do not enclose the value in quotation marks if the value should not contain quotation marks.

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<UserVariables>
    <UserVar Name="UVAcctType">
        <Values>
            <Option>Gold</Option>
        </Values>
    </UserVar>
</UserVariables>
```

**Save**

Save { -s flowchart_name | -p pid | -a }

The `Save` command saves the current state of an active flowchart.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-s</td>
<td>Saves a single, specific flowchart by name defined by the <code>flowchart-name</code>.</td>
</tr>
<tr>
<td>-p</td>
<td>Saves a flowchart defined by the <code>pid</code>.</td>
</tr>
<tr>
<td>-a</td>
<td>Saves all running flowcharts.</td>
</tr>
</tbody>
</table>

**Set**

Set [variable [=value]]

The `Set` command displays and sets environment variables. Omit the value to view the current value and provide it to set the specified variable.

**Shutdown**

Shutdown [-f]

The `Shutdown` command shuts down the listener.

The system checks for any running flowchart. If running flowcharts are found, a warning message displays, asking for confirmation of shutdown.

To override and force shutdown, use `-f`.

**Status**

Status [-d | -i] [-u] [-v | -c]

The `Status` command displays information both about running and suspended flowcharts (with flowchart name, owner, and file location).

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>Adds Server ID, Campaign Code, and Campaign ID to the displayed output.</td>
</tr>
<tr>
<td>i</td>
<td>Displays the process ID (PID) only</td>
</tr>
<tr>
<td>u</td>
<td>Use this option when the displayed data contains non-ASCII characters.</td>
</tr>
</tbody>
</table>
The **Status** command identifies the processes as follows:

- **c** - connected (client is connected to the listener process -- may be running, may not)
- **d** - disconnected (client is closed but the flowchart is running in the background)
- **o** - orphaned (client is not connected to the flowchart and it is not running in the background -- this is a lost process that cannot be reconnected to the listener and should be killed so people can log into it)

**Note:** A value of *<no writer>* in the WRITER column refers to a server process that does not have a client in edit mode, which may happen when no client is connected, and for login sessions.

**Stop**

Stop 

\[-f\] {-s flowchart_name | -p pid | -a}

The **Stop** command checks for active clients, warns if any are present (this can be overridden with the **-f** force option), and stops the Unica server processes.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-s</td>
<td>Stops a single, specific flowchart by name defined by the flowchart_name</td>
</tr>
<tr>
<td>-p</td>
<td>Stops flowcharts by pid.</td>
</tr>
<tr>
<td>-a</td>
<td>Stops all running flowcharts.</td>
</tr>
</tbody>
</table>

To override and force stop, use **-f**.

**Suspend**

Suspend

\[-f\] {-s flowchart_name | -p pid | -a}

The **Suspend** command allows you to “quiesce” a running campaign and save the state for later restart with the matching command, **Resume**. All flowcharts currently running an output process complete data export activities and the flowchart is then saved as a paused flowchart. This causes the least amount of work to be lost and preserves data integrity of output files. If flowcharts must be stopped immediately, issue a **Save** command followed by **Stop**.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-s</td>
<td>Suspends a single, specific flowchart by name defined by the flowchart_name &gt;</td>
</tr>
<tr>
<td>-p</td>
<td>Suspends flowcharts specified by pid</td>
</tr>
<tr>
<td>-a</td>
<td>Suspends all running flowcharts</td>
</tr>
</tbody>
</table>
The system finishes running any currently running processes, and does not allow any subsequent processes to start. The flowchart is saved and written to the list of suspended flowcharts.

The -f parameter allows you to force a suspend. Once suspended, the flowchart is written to the listener as a suspended flowchart.

**Note:** If the flowchart is not running at the time of Suspend, it is saved, but not written to the listener and cannot be started with Resume.

**Uncap (Distributed Marketing)**

Uncap

The Uncap command revokes the Cap (Distributed Marketing) command. See Cap (Distributed Marketing).

**Version**

Version

The Version command displays the version of unica_svradm and the version of the listener process to which you are connected. You can use this command to help troubleshoot a version mismatch error.

**To kill a running flowchart**

You may need to kill a flowchart to immediately stop it. Because flowchart names can be the same in different campaigns and sessions, you should follow the instructions in this section.

1. At the command prompt, enter the following command to obtain a list of running flowcharts on the server:
   
   ```bash
   % unica_svradm status
   ```

   Note that even if the flowchart names are the same, you can use the absolute path to uniquely identify a flowchart.

2. Note the PID associated with the flowchart that you want to kill.

3. To kill the flowchart, enter the following command at the command prompt, replacing PID with the PID of the flowchart that you want to kill:

   ```bash
   unica_svradm kill -p PID
   ```

   When a flowchart is killed, its buffer is not flushed to disk. Instead, the last checkpoint copy is saved.

**Campaign session utility (unica_acsesutil)**

Use the Campaign session utility (unica_acsesutil) to perform the following tasks:

- import and export campaigns, sessions, and flowcharts from one server to another;
- pass in a flowchart file or table catalog as input and generate a table catalog in either binary or XML format as output;
- update record counts and lists of distinct values for a session or a catalog.
Note: The unica_acsesutil utility only supports importing and exporting objects between servers with the same version of Campaign installed.

Environment variables required for unica_acsesutil

To run unica_acsesutil, the following environment variables must be set:

- UNICA_PLATFORM_HOME
- CAMPAIGN_HOME

On UNIX only, the database-specific library path appropriate to your UNIX platform:

- LIBPATH for AIX®
- SHLIB_PATH for HP-UX
- LD_LIBRARY_PATH for Linux or Sun Solaris

Campaign session utility use cases

Use the session utility (unica_acsesutil) to perform the following tasks:

- “Exporting and importing objects between servers”
- “Backing up sessions” on page 148
- “Updating record counts and lists of distinct values” on page 148
- “Manipulating table catalogs” on page 148
- “Documenting catalog contents” on page 149

Exporting and importing objects between servers

Note: The unica_acsesutil utility only supports importing and exporting objects between servers with the same version of Campaign installed.

Use unica_acsesutil to export and import campaigns, sessions, and flowcharts from one server to another, with the following limitations:

- Exporting campaigns or sessions exports only the associated system tables and metadata. Associated flowcharts must be exported separately; you can export flowcharts only one at a time.
- Before you can import a flowchart to a target system, its flowchart (.ses) file, as well as its associated campaign or session, must already exist on the target system. Therefore you should export and import all campaigns and sessions before exporting and importing their associated flowcharts, and you must manually copy the flowchart (.ses) files to the target server.
- Using the -s parameter to specify a Campaign flowchart (.ses) file on which to operate is required regardless of the object type you are exporting or importing. When exporting or importing a campaign or session with multiple associated flowcharts, any of the associated .ses files can be used.
- When you attempt to import eMessage or Distributed Marketing flowcharts, unica_acsesutil checks to see that the relevant application is installed on the target system. If the required application is not installed on the target system, unica_acsesutil generates an error and the selected objects are not imported.

About the exporting and importing process: The process of moving objects between servers using unica_acsesutil is done in several stages, with some manual steps required:
1. Using the information in the flowchart (.ses) file specified with the -s option, the unica_acsesutil utility writes exported objects and information to an intermediate output file, specified by the -e option.

2. You manually move (copy) the output file to the target server.

3. On the target server, you import the unica_acsesutil output file using the -i option.

About conflicts with existing data when importing: When unica_acsesutil imports data into the system tables (for example, session info, triggers, or custom macros), it checks whether each object already exists on the target system. The check is done based on internal object ID. That is, for campaigns, if the internal campaign ID is not unique, unica_acsesutil asks if the campaign should be overwritten. If you choose to overwrite the campaign, unica_acsesutil removes all data associated with the existing campaign on the target server, and then imports the new campaign. Similarly, when importing offers, unica_acsesutil checks the internal Offer ID for uniqueness.

If an object with the same ID already exists, you have the option to skip that object in the import process or to replace the existing object.

Note: If you know that a conflicting object (such as a campaign, session, or offer) already exists on the target system prior to import, you should consider deleting the object before running the import, to avoid being prompted to resolve the conflict.

To export a campaign, session, or flowchart:

```
unica_acsesutil -s <sesFileName> -h <partitionName>
    -e <exportFileName> [-f { flowchart | campaign | session }]
    [-S <datasource> -U <DBusername> -P <DBpassword>]
```

Example 1: export campaign

```
unica_acsesutil -s "campaigns/Campaign C000001_C000001.ses" -h partition1
    -e campaign.exp -f campaign
```

This example generates an output file named campaign.exp for exporting the campaign associated with Flowchart1, based on the "campaigns/Campaign C000001_C000001.ses" file located on partition1.

Example 2: export flowchart

```
unica_acsesutil -s "campaigns/Campaign C000001_C000001_ Flowchart1.ses"
    -h partition1 -e flowchart.exp -f flowchart
```

This example generates an output file named flowchart.exp for exporting flowchart C000001_Flowchart1, based on the "campaigns/Campaign C000001_C000001_ Flowchart1.ses" file located on partition1.

To import a campaign, session, or flowchart:

Note: Before you can import a flowchart, its flowchart (.ses) file, as well as its associated campaign or session, must exist on the target system. Therefore, before importing a flowchart, you must: 1) manually copy the associated .ses file from the source system to the target system, and 2) import the associated campaign or session to the target system.
unica_acsesutil -s <sesFileName> -h <partitionName> 
-1 <importFileName> [-f { flowchart | campaign | session }] 
[-b { abort | replace | skip }] 
[S <datasource> -U <DBusername> -P <DBpassword>]

Example 1: import campaign
unica_acsesutil -s "campaigns/Campaign C000001_C000001.ses" -h partition1 
-1 campaign.exp -f campaign

This example uses the previously generated campaign.exp file and imports Campaign C000001 data to the system tables on the target system, as well as to the "campaigns/Campaign C000001_C000001.ses" file located on partition1.

Example 2: import flowchart
unica_acsesutil -s "campaigns/Campaign C000001_C000001_Flowchart1.ses" -h partition1 -i import.exp -f flowchart

This example uses the previously generated flowchart.exp file and imports the data associated with Campaign C000001_Flowchart1 to the system tables on the target system, as well as to the "campaigns/Campaign C000001_C000001_Flowchart1.ses" file located on partition1.

Backing up sessions
Use the Campaign session utility to back up sessions. You can write a script to export every file in the session directory and import them to a backup system.

Updating record counts and lists of distinct values
Use the Campaign session utility to update record counts and/or lists of distinct values, as well as to schedule automatic re-computation of those counts.

Three parameters are available to indicate what type of counts to re-compute:
• -n -- recompute record counts only
• -l -- recompute list of distinct values only
• -a -- recompute record counts and list of distinct values for all tables

Use these options to recompute all record counts and/or list of values for a session (-s) or for a catalog (-t). You can combine these options with other options such as import (-i).

To recompute counts for all mapped tables in a flowchart
unica_acsesutil -s sesFileName -i importFileName 
[[-a | -n | -l ][-S Datasource -U DBUser -P DBPassword]]

To recompute counts for tables in a table catalog
unica_acsesutil -t catFileName 
[[-a | -n | -l ][-S Datasource -U DBUser -P DBPassword]]

Note: You must specify the parameters that define the database connection (-S, -U, -P) if the connection information is not stored in the flowchart.

Manipulating table catalogs
You can use the Campaign session utility to manipulate table catalogs outside of Campaign.

A common use of XML table catalogs is to perform global search and replace of data source names, for example to convert a table catalog developed for use
against a test database, so that it works against a production database. In this case, you can export the table catalog as XML, perform global search and replace as needed, then save the XML table catalog and load it for use.

**Step 1 - Convert to XML format**

You use the Campaign session utility only for the first step of this process, which is to generate an XML format file that contains all the data from the requested catalog. If the catalog is already in an XML format, this step is not required.

Use the command:

```
unica_acsesutil -t catFileName -x [-o outputFileName] [-u] [-p]
([-a] [-n] [-l])[-S dataSource -U DBUserName -P DBPassword]
```

**Step 2 - Edit as needed**

You can now edit the XML file generated in step 1 as needed. To ensure that the file remains well formed, you should use an XML editor that checks the file syntax.

**Step 3 (optional) - Convert to binary format**

If required, you can convert the XML catalog file back to a binary format catalog.

Use the command:

```
unica_acsesutil -t <catFileName> -x -o <outputFileName>
```

**Note:** Keeping catalogs in XML format risks exposing data access passwords. If you maintain catalogs in XML format, you should ensure that the file(s) are protected at the operating system level.

**Step 4 - Load the new catalog in a session**

After conversion back into a binary format, you can now load the new catalog into a session.

**Documenting catalog contents**

You can use two techniques to document catalog contents:
- Use an XML catalog file to generate a report
- Print table mappings using the Campaign session utility

**Using an XML catalog file**

Use `unica_acsesutil` to generate an XML format file that contains all the data from the requested catalog.

There is currently no Unica utility to convert an XML catalog file into a user-friendly report.

**Printing table mappings**

Use `unica_acsesutil` to print out the table mapping information from a catalog.

Use the command:

```
unica_acsesutil -t catFileName -h partitionName -p
```
Campaign session utility return values

The `unica_acsesutil` utility returns a value of 0 if it runs successfully. It returns a 1 if no files are found with the specified flowchart or catalog file name.

Campaign session utility syntax

```
unica_acsesutil -s sesFileName -h partitionName
[-r | -c | -x [-o outputFileName]] [-u] [-v]
[[-e exportFileName [-f {flowchart | campaign | session}]]
| [-i importFileName [-t catFileName]]
| [-b {abort | replace | skip}]]
[-p] [-a | -n | -l]
[-S dataSource -U DBUser -P DBPassword]*
[-y userName] [-z password]
[-j owner] [-K policy]
```

Campaign session utility options

The `unica_acsesutil` utility supports the following options.

```
<table>
<thead>
<tr>
<th>Option</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-a</td>
<td>-a</td>
<td>Recomputes record counts and the list of distinct values for all tables.</td>
</tr>
</tbody>
</table>
| -b     | -b {abort | replace | skip} | Applies only for the import option (-i). Specifies that the import be done in batch mode. Requires one of the following arguments to specify how to handle duplicate objects (if there is an ID conflict):
  * abort - If a duplicate object is detected, the import stops.
  * replace - If a duplicate object is detected, replace it with the imported object.
  * skip - If a duplicate object is detected, do not replace it and continue the import. |
| -c     | -c <outputFileName> | Generates a table catalog in `outputFileName` in .cat format (Campaign internal format). This option is ignored with the `-s` option. |
| -e     | -e <exportFileName> | Exports the object type specified by the `-f` option to a file named `exportFileName`. If the `-f` option is not used, by default a flowchart is set for export. |
| -f     | -f {flowchart | campaign | session} | Specifies the type of object to export. If this option is omitted, by default a flowchart is set for export. If `-f` is used, requires one of the following arguments: flowchart, campaign, session. |
| -h     | -h <partitionName> | Specifies the name of the partition in which the flowchart file (specified with `-s`) is located. This parameter is required. |
| -i     | -i <importFileName> | Specifies the name of the file being imported. This should be a file that was exported using the `-e` option in a previous export operation. |
```
<table>
<thead>
<tr>
<th>Option</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-j</td>
<td>-j &lt;owner&gt;</td>
<td>Specifies the owner of the file being imported or exported.</td>
</tr>
<tr>
<td>-k</td>
<td>-k &lt;policy&gt;</td>
<td>Specifies the security policy of the file being imported.</td>
</tr>
<tr>
<td>-l</td>
<td>-l</td>
<td>Recomputes only the list of distinct values.</td>
</tr>
<tr>
<td>-n</td>
<td>-n</td>
<td>Recomputes only record counts.</td>
</tr>
<tr>
<td>-o</td>
<td>-o &lt;outputFileName&gt;</td>
<td>Specify the catalog with the name outputFileName. If unspecified, the default is catFileName.xml or catFileName.cat, depending on whether you use the -x or -c option. The output file name should specify a destination directory when using wildcards.</td>
</tr>
<tr>
<td>-P</td>
<td>-P &lt;DBPassword&gt;</td>
<td>Specifies the password for the database user account. Used with the -U and -S options.</td>
</tr>
<tr>
<td>-p</td>
<td>-p</td>
<td>Print table mappings to the console.</td>
</tr>
<tr>
<td>-r</td>
<td>-r &lt;outputFileName&gt;</td>
<td>Generate a flowchart XML report in outputFileName. This parameter is ignored when you use the -t option (using a table catalog as input).</td>
</tr>
<tr>
<td>-S</td>
<td>-S &lt;dataSource&gt;</td>
<td>Specifies the name of the data source for the object being operated on. Use with the -U &lt;database_user&gt; and -P &lt;database_password&gt; options.</td>
</tr>
<tr>
<td>-s</td>
<td>-s &lt;sesFileName&gt;</td>
<td>Specifies a Campaign flowchart (.ses) file on which to operate. Specifying an .ses file is always required for exporting and importing, regardless of the object type (campaign, session, or flowchart). When exporting or importing a campaign or session with multiple associated flowcharts, any of the associated .ses files can be used. The file name should include the path below the partition in which this flowchart file is located (defined using the -h option). For example, a valid value for -s is: &quot;campaign/Campaign 00001_C00001_Flowchart 1.ses&quot; The &lt;sesFileName&gt; can contain wildcard characters to operate on multiple matching flowcharts.</td>
</tr>
<tr>
<td>-t</td>
<td>-t &lt;catFileName&gt;</td>
<td>Read a table catalog named &lt;catFileName&gt; as the input. The &lt;catFileName&gt; can contain wildcard characters.</td>
</tr>
<tr>
<td>-U</td>
<td>-U &lt;DBUserName&gt;</td>
<td>Specifies the user login for the data source specified by the -S option. Use with the -P option, which specifies the database password for this database user.</td>
</tr>
<tr>
<td>-u</td>
<td>-u</td>
<td>Uses existing database authentication information when saving table catalogs.</td>
</tr>
<tr>
<td>-v</td>
<td>-v</td>
<td>Displays the version number and exits.</td>
</tr>
<tr>
<td>-x</td>
<td>-x &lt;outputFileName&gt;</td>
<td>Generates a table catalog file in an alternate XML format in outputFileName. If the input table catalog is a .cat file, it generates a corresponding .xml file, and vice versa.</td>
</tr>
<tr>
<td>-y</td>
<td>-y &lt;userName&gt;</td>
<td>Specifies the IBM Unica Marketing user name.</td>
</tr>
</tbody>
</table>
Table 41. Campaign session utility options (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-z</td>
<td>-z &lt;password&gt;</td>
<td>Specifies the password for the IBM Unica Marketing user specified by the -y option.</td>
</tr>
</tbody>
</table>

**Campaign cleanup utility (unica_acclean)**

Use the cleanup utility (unica_acclean) to identify and clean up temporary files and database tables in the current partition. The cleanup utility can be used on both the Campaign system tables database and on user tables databases.

Users running this utility must have the “Perform Cleanup Operations” permission, granted by their Campaign administrator. If users attempt to run this utility without the appropriate privileges, the tool terminates after displaying an error.

**Note:** This tool does not operate across partitions. Each time it is run, unica_acclean operates on tables and files only in the specified partition.

The following items can be identified and cleaned up by the utility:
- temporary files and tables associated with a specified object or object type, based on given criteria.
- orphaned temporary files and tables -- temporary files and tables that have been left behind after their associated object was deleted.

**Environment variables required for unica_acclean**

To run unica_acclean, the following environment variables must be set:

- UNICA_PLATFORM_HOME
- CAMPAIGN_HOME
- LANG

Setting CAMPAIGN_PARTITION_HOME is optional.

**Campaign cleanup utility use cases**

Use the cleanup utility (unica_acclean) to perform the following tasks:
- “Generating a list of orphaned files and tables”
- “Deleting the files and tables listed in a file” on page 153
- “Deleting all orphaned temp files and tables” on page 153
- “Generating a list of files and tables selectively by object type and criteria” on page 154
- “Deleting files and tables selectively by object type and criteria” on page 154

**Generating a list of orphaned files and tables**

You can use the cleanup utility to identify and output a list of orphaned temp files and tables.

**Note:** Unica recommends as a best practice that you output a list of identified orphaned files and tables for verification before performing deletions using the cleanup utility, rather than running the utility to immediately delete files and tables. This can help prevent accidental deletes; there is no recovery after deletion.
To output a list of orphaned files and tables:

\texttt{unica\_acclean -o <list file name> -w orphan}

For this usage, \texttt{-w orphan} is required, and you cannot specify any criteria.

Use the \texttt{-o} option to specify the file name. You can also specify the path where you want the file to be saved. If you do not include the path, the file is saved in the same directory as the \texttt{unica\_acclean} utility.

\textbf{Example}

\texttt{unica\_acclean -o "OrphanList.txt" -w orphan}

This example generates a list of orphaned files and tables and writes it to the file \texttt{OrphanList.txt}.

**Deleting the files and tables listed in a file**

You can use the cleanup utility to delete all temp files and temp tables listed in a file generated by the utility.

To delete the files and tables listed in a file:

\texttt{unica\_acclean -d -i "OrphanList.txt"}

where \texttt{OrphanList.txt} is the file containing the list of files to be deleted, generated by the cleanup utility.

If a line is read from the list file that is not a temp file or a temp table, the cleanup tool skips that item and logs an error to the console and the log file indicating that the item will not be deleted.

**Deleting all orphaned temp files and tables**

You can use the cleanup utility to delete all temp files and tables that it identifies as being orphaned, from the system and user tables databases and the file system.

To delete all orphaned temp files and tables from your system:

\texttt{unica\_acclean -d -w orphan}

**About orphaned files and tables**

The \texttt{unica\_acclean} utility determines whether files and tables are orphaned in the following way:

**Tables**

The utility scans databases in the current partition to obtain the list of temporary tables. Tables are identified as “temporary” based on the “TempTablePrefix” properties specified for each data source on the Marketing Platform Configuration page.

Once the list of temporary tables is compiled, all flowchart files in the system are scanned to see if any of these temporary tables are used by a flowchart. Any temporary table not referenced by a flowchart is considered orphaned.
Note: The cleanup utility scans only those data sources defined in the Marketing Platform User Administration module for the user running the utility. Therefore, users running the cleanup utility should always make sure that they have authentication rights to the global or appropriate set of data sources for scanning.

Files

The utility scans two locations to identify temporary files:

- the partition’s temp directory (<partition home>/<partition>/tmp) to obtain the list of files identified as “temporary” files based on the .t"# extension.
- the <partition home>/<partition>/[campaigns | sessions] directory for files having a known Campaign temp file extension.

Once the list of temporary files is compiled, all flowchart files in the system are scanned to see if any of these temporary files are not used by any flowchart. Any temporary file not referenced by a flowchart is considered orphaned.

Generating a list of files and tables selectively by object type and criteria

You can use the cleanup utility to generate a list of files and tables by object type and criteria.

To generate a list of files and tables selectively by object type and criteria:

```
unica_acclean -o <list file name> -w {flowchart | campaign | session | sessionfolder | campaignfolder} -s criteria [-r]
```

Example 1: list temp files and tables by campaign folder

```
unica_acclean -o "JanuaryCampaignsList.txt" -w campaignfolder -s "NAME='JanuaryCampaigns'" -r
```

This example generates a list of temporary files and tables associated with campaigns and flowcharts in the campaign folder named “JanuaryCampaigns” as well as all subfolders of “JanuaryCampaigns”, and writes it to the file JanuaryCampaignsList.txt.

Example 2: list temp files and tables by flowchart LASTRUNENDDATE

```
unica_acclean -o "LastRun_Dec312006_List.txt" -w flowchart -s "LASTRUNENDDATE < '31-Dec-06'"
```

This example generates a list of all temp files and tables with LASTRUNENDDATE earlier than December 31, 2006, in all flowcharts, and writes it to the file LastRun_Dec312006_List.txt.

Note: Make sure that any date criteria are specified in the correct date format for your database.

Deleting files and tables selectively by object type and criteria

You can use the cleanup utility to delete temporary files and tables by object type and criteria.

To delete files and tables selectively by object type and criteria:
unica_acclean -d -w {flowchart | campaign | session | sessionfolder | campaignfolder} -s <criteria> [-r]

Examples

Example 1: Delete temp files and tables by campaign folder

unica_acclean -d -w campaignfolder -s "NAME='JanuaryCampaigns'" -r

This example deletes temporary files and tables associated with campaigns and flowcharts in the campaign folder named "JanuaryCampaigns", as well as to all subfolders of "JanuaryCampaigns".

Example 2: delete temp files and tables by flowchart LASTRUNENDDATE

unica_acclean -d -w flowchart -s "LASTRUNENDDATE < '31-Dec-06'"

This example deletes all temp files and tables with LASTRUNENDDATE earlier than December 31, 2006, in all flowcharts.

Important: Make sure that any date criteria are specified in the correct date format for your database.

Campaign cleanup utility syntax

unica_acclean {-d|-o <list file name>}
-w {flowchart | campaign | session | sessionfolder | campaignfolder | other} -s <criteria>
[-u <user name>] [-p <password>] [-n <partition name>]
[-l {low|medium|high|all}] [-f <log file name>]

The cleanup utility is non-interactive unless user name or password are not specified. If user name is not specified, the tool prompts for user name and password. If password is not specified, the tool prompts for password.

Campaign cleanup utility options

The unica_acclean utility supports the following options.

Table 42. Campaign cleanup utility options

<table>
<thead>
<tr>
<th>Option</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-d</td>
<td>-d</td>
<td>Deletes temp tables and files. All flowchart files are scanned, and based on the result, temporary files and tables are determined.</td>
</tr>
<tr>
<td>-f</td>
<td>-f &lt;log file name&gt;</td>
<td>Specifies the name of the file where errors are logged, located in the &lt;PARTITION_HOME&gt;/logs directory. By default, this file is named unica_acclean.log. You can modify the log file name, but specifying a different location is not currently supported.</td>
</tr>
<tr>
<td>-h</td>
<td>-h</td>
<td>Displays usage help. Any invalid command-line invocation also displays the help.</td>
</tr>
</tbody>
</table>
Table 42. Campaign cleanup utility options (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-i</td>
<td>-l &lt;clean file name&gt;</td>
<td>Specifies the file listing the items to be deleted. Best practice is to use the same file generated by the cleanup tool, using the -o option.</td>
</tr>
<tr>
<td>-l</td>
<td>-l [low</td>
<td>medium</td>
</tr>
<tr>
<td>-n</td>
<td>-n &lt;partition name&gt;</td>
<td>Use this option to supply the name of the partition. If the partition name is not specified, the default of “partition 1” is used.</td>
</tr>
<tr>
<td>-o</td>
<td>-o &lt;listfilename&gt;</td>
<td>Outputs the list of tables and files to the specified file, but does not delete them.</td>
</tr>
<tr>
<td>-p</td>
<td>-p &lt;password&gt;</td>
<td>Must be used when the -u option is used. Use this option to supply the password for the user specified with the -u option.</td>
</tr>
<tr>
<td>-r</td>
<td>-r</td>
<td>This option can be used only with the -w option for either campaignfolder or sessionfolder objects. When a folder is specified for cleanup and the -r option is added, the unica_acclean tool performs the operation for all subdirectories of the specified folder. If only the -w option is used with a folder, unica_acclean performs the operation only on the top-level folder.</td>
</tr>
<tr>
<td>-s</td>
<td>-s &lt;criteria&gt;</td>
<td>Used with the -w option, defines criteria for cleanup, specified as a SQL query. The SQL LIKE operator can be used to do a search based on wildcards. Any data table column for the specified object can be used as criteria: • When specifying a campaign folder or session folder as the object, criteria are based on columns in the UA_Folder table. • When specifying a campaign as the object, criteria are based on columns in the UA_Campaign table. • When specifying a flowchart as the object, criteria are based on columns in the UA_Flowchart table. • When specifying a session as the object, criteria are based on columns in the UA_Session table.</td>
</tr>
<tr>
<td>-u</td>
<td>-u &lt;user name&gt;</td>
<td>Must be used when the -p option is used. Use this option to supply the IBM Unica Marketing user name of the user running the utility.</td>
</tr>
<tr>
<td>-v</td>
<td>-v</td>
<td>Displays version and copyright information for the cleanup utility.</td>
</tr>
</tbody>
</table>

<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-w</td>
<td>-w {flowchart</td>
<td>campaign</td>
</tr>
</tbody>
</table>

Campaign report generation utility (unica_acgenrpt)

unica_acgenrpt is a command-line report generation utility that exports a flowchart cell report from a specified flowchart. The report is generated from the flowchart's .ses file. Use the unica_acgenrpt utility to generate and export the following types of cell reports:

- Cell List
- Cell Variable Profile
- Cell Variable Crosstab
- Cell Content

For more information about these reports, see the *IBM Unica Campaign User's Guide*.

The default file name of the exported file is unique and based on the flowchart name. It is saved in the directory you specify. If the file already exists, it is overwritten. The default file format is tab-delimited.

**Note:** The exported file contains the current data from the flowchart's .ses file. If a flowchart is writing to the .ses file when the unica_acgenrpt utility is run, the resulting report file could contain data from the previous run of the flowchart. If you are invoking the unica_acgenrpt utility using an on-success trigger, your script should contain an appropriate delay before executing unica_acgenrpt to account for the length of time that your flowcharts will need to finish writing to the .ses file. The amount of time required to save the .ses file varies greatly depending upon the size and complexity of the flowchart.

Use of the unica_acgenrpt utility requires the Run genrpt Command Line Tool permission in the Administrative Roles security policy. For more information on security policies and permissions, see Chapter 2, “Managing security in IBM Unica Campaign,” on page 3.

**Use case: capture cell counts from flowchart runs**

To analyze cell counts over time, use the unica_acgenrpt utility to capture the cell counts from flowchart production runs. For the report type, specify CellList.
To automate this data capture, use an on-success trigger in your flowcharts to call a script that invokes the `unica_acgenrpt` utility. Use the `<FLOWCHARTFILENAME>` token to return the full path name of the flowchart’s .ses file. To make the data available for analysis, use another script that loads the resulting export file into a table.

**IBM Unica Campaign report generation utility syntax**

The `unica_acgenrpt` utility has the following syntax:

```
unica_acgenrpt -s <sesFileName> -h <partitionName> -r <reportType> [-p <name>=<value>] [-d <delimiter>] [-n] [-i] [-o <outputFileName>] [-y <user>] [-z <password>] [-v]
```

**IBM Unica Campaign report generation utility options**

The `unica_acgenrpt` utility supports the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-s</code></td>
<td><code>-s &lt;sesFileName&gt;</code></td>
<td>Specifies a Campaign flowchart (.ses) file on which to operate. The file name should include the path below the partition in which this flowchart file is located (defined using the <code>-h</code> option). For example, a valid value for <code>-s</code> is: &quot;campaign/Campaign C00001_C00001_Flowchart 1.ses&quot;. The <code>&lt;sesFileName&gt;</code> can contain wildcard characters to operate on multiple matching flowcharts.</td>
</tr>
<tr>
<td><code>-h</code></td>
<td><code>-h &lt;partitionName&gt;</code></td>
<td>Specifies the name of the partition in which the flowchart file (specified with <code>-s</code>) is located.</td>
</tr>
</tbody>
</table>
| `-r`   | `-r <reportType>` | Specifies the type of report to be generated. Valid values include:  
  - CellList (Cell List report)  
  - Profile (Cell Variable Profile report)  
  - XTab (Cell Variable Crosstab report)  
  - CellContent (Cell Content report) |
| `-p`   | `-p <name>=<value>` | Specifies report parameters using name=value pairs. The `-p` option can appear multiple times, and must appear after the `-r` option. For a list of valid name=value pairs supported by the `-p` option, see “Parameters used with the `unica_acgenrpt` `-p` option” on page 159. |
| `-d`   | `-d <delimiter>` | Separates columns in the output file. The default is TAB. |
| `-n`   | `-n` | Includes column names before the report data in the output file. |
| `-i`   | `-i` | Appends a unique text identifier to the end of the output file. |
### Table 43. Campaign report generation utility options (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-o</td>
<td>-o &lt;outputFileName&gt;</td>
<td>Specifies the output file name. The default is &lt;sesFileName&gt; with .ses replaced by .csv; specifies a destination directory when using wildcards.</td>
</tr>
<tr>
<td>-y</td>
<td>-y &lt;user&gt;</td>
<td>Specifies a login user name for Campaign.</td>
</tr>
<tr>
<td>-z</td>
<td>-z &lt;password&gt;</td>
<td>Specifies the password for the user login.</td>
</tr>
<tr>
<td>-v</td>
<td>-v</td>
<td>Displays the version number of the utility and exits.</td>
</tr>
</tbody>
</table>

### Parameters used with the unica_acgenrpt -p option

The unica_acgenrpt utility’s -p option allows you to specify the following parameters using name=value pairs for the Cell Variable Profile, Cell Variable Crosstab, and Cell Content reports.

#### Cell Variable Profile report

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Usage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cell</td>
<td>Required</td>
<td>Name of a cell you want to profile.</td>
</tr>
<tr>
<td>field</td>
<td>Required</td>
<td>Name of the field you want to use to profile the cell.</td>
</tr>
<tr>
<td>cell2</td>
<td>Optional</td>
<td>Name of an additional cell to profile.</td>
</tr>
<tr>
<td>bins</td>
<td>Optional</td>
<td>Number of bins you want to include in the report. If the number you specify is less than the number of different field values, some fields will be joined in one bin. The default is 25.</td>
</tr>
<tr>
<td>meta</td>
<td>Optional</td>
<td>Specifies whether you want to profile by meta type. Valid values are TRUE and FALSE. The default is TRUE.</td>
</tr>
</tbody>
</table>

#### Cell Variable Crosstab report

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Usage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cell</td>
<td>Required</td>
<td>Name of a cell you want to profile.</td>
</tr>
<tr>
<td>field1</td>
<td>Required</td>
<td>Name of the first field you want to use to profile the cell.</td>
</tr>
<tr>
<td>field2</td>
<td>Required</td>
<td>Name of the second field you want to use to profile the cell.</td>
</tr>
<tr>
<td>cell2</td>
<td>Optional</td>
<td>Name of an additional cell to profile.</td>
</tr>
<tr>
<td>bins</td>
<td>Optional</td>
<td>Number of bins you want to include in the report. If the number you specify is less than the number of different field values, some fields will be joined in one bin. The default is 10.</td>
</tr>
<tr>
<td>meta</td>
<td>Optional</td>
<td>Specifies whether you want to profile by meta type. Valid values are TRUE and FALSE. The default is TRUE.</td>
</tr>
</tbody>
</table>
Cell Content report

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Usage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cell</td>
<td>Required</td>
<td>Name of the cell you want to include in the report.</td>
</tr>
<tr>
<td>field</td>
<td>Optional</td>
<td>Name of a field you want to include in the report. Repeat multiple times to specify additional fields. If no field is specified, the report displays values for the audience field(s).</td>
</tr>
<tr>
<td>records</td>
<td>Optional</td>
<td>Number of records you want to include in the report. The default is 100.</td>
</tr>
<tr>
<td>skipdups</td>
<td>Optional</td>
<td>Specifies whether you want to skip records with duplicate ID values. Enabling this option is useful if you are using non-normalized tables. Valid values are TRUE and FALSE. The default is FALSE.</td>
</tr>
</tbody>
</table>

**ActiveX cleanup utility (uacflchk)**

The Campaign ActiveX cleanup utility, uacflchk.exe, is designed to resolve *Object not Loaded / Object does not support this property or method* errors when a user tries to access Campaign pages with ActiveX controls. This problem most often occurs when the files needed to run ActiveX are not downloaded to the Windows Downloaded Program Files directory.

The utility runs in two modes: check and clean. You should run the utility in check mode first, to ensure that you take any necessary action before running the tool in clean mode.

The uacflchk.exe file is located in the tools\win32 directory under your Campaign installation.

**ActiveX cleanup utility prerequisites**

The following requirements must be met before running the uacflchk utility:

- The uacflchk utility must have access to the file system and registry of the machine where you want to perform the cleanup. Copy it to the machine where you want to perform the cleanup or run it from a mapped drive.
- Close all browser windows before running the utility.

**ActiveX cleanup utility syntax**

The uacflchk utility has the following syntax:

```
uacflchk
uacflchk /clean
uacflchk /clean /q
```
Running the ActiveX cleanup utility in check mode (no options)

Running the uacflchk utility in check mode (no options) returns a listing of the relevant registry entries, dependencies, conflicting files, and missing files. These messages tell you where the problem lies, so you can take the appropriate action.

You should run the utility in check mode first, to ensure that you take any necessary action before running the tool in clean mode.

ActiveX cleanup utility check mode messages

This lists shows the possible messages and the actions you should take for each message when running the uacflchk utility in check mode (no options).

- **Message: Found <file> as <path>.**
  This means: The file is registered in the path noted.
  Do this: Run the tool in cleanup mode.

- **Message: Found conflicting files in <path>.**
  This means: An installed file was found in an unexpected location.
  Do this: This will probably not cause a problem but is reported for your information.

- **Message: Could not delete file/directory.**
  This means: A file or directory delete operation could not be performed. Either the user does not have sufficient privileges to delete the file/directory, or the file/directory is in use.
  Do this: Ensure that the user has sufficient privileges for the operation and shut down any application that may be accessing the file.

- **Message: Could not obtain download information.**
  This means: An attempt to query the registry for download information failed.
  Do this: Ensure that the user has sufficient privileges to access the registry and that the registry is not corrupt.

- **Message: Found wrong dependency.**
  This means: A previous download was found but contained unexpected files.
  Do this: Contact Unica Technical Support.

ActiveX cleanup utility options

The uacflchk utility can be run with no options (check mode) or with the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/clean</td>
<td>Search for ActiveX components in the Windows registry entries and file system. Asks whether to delete registry entries and files under %WINDIR%\Downloaded Program Files. Other files will be reported but not deleted as they probably will not cause any problems. When used with the /q option, deletes without prompts.</td>
</tr>
<tr>
<td>/q</td>
<td>Delete files and registry entries without prompting. Used with the \clean option.</td>
</tr>
</tbody>
</table>
Database testing utilities

Campaign supports the following command-line database testing utilities, which you can use to test connections to a target database, to execute queries and to perform a variety of tasks:

- “cxntest utility”
- “odbctest utility”
- “db2test utility” on page 164
- “oratest utility” on page 164

These utilities are in the /Campaign/bin directory on the Campaign server.

cxntest utility

The cxntest utility allows you to test connections to a target database and, once connected, to issue a variety of commands.

To use the cxntest utility

1. From a command prompt on the Campaign server, run the cxntest utility.
2. The cxntest utility is prompt-driven. You must enter the following information at the prompts:
   a. The name of the connection library for your database
   b. The name of the data source
   c. A database user ID
   d. The password associated with the database user ID
   The utility does not prompt for confirmation of your selections.
3. If the connection is successful, you can enter the following commands at the prompt:
   - bprint[pattern]
     Performs an array fetch on a list of tables, 500 at a time. Can optionally specify a search pattern.
   - describe[table]
     Describes the specified table. Returns each column name and its corresponding data type, storage length, precision, and scale.
   - exit
     Terminates the database connection and exits.
   - help
     Displays a list of supported commands.
   - print [pattern]
     Returns a list of tables. Can optionally specify a search pattern.
   - quit
     Terminates the database connection and exits.
   - SQL_command
     Executes any valid SQL command or series of SQL commands.

odbctest utility

The odbctest utility allows you to test Open DataBase Connectivity (ODBC) connections to a target database and, once connected, to issue a variety of commands. It is supported on AIX, Solaris, Windows and HP-UX systems (32-bit only).
Note: For Oracle and DB2® databases, use their native utilities.

**To use the odbctest utility**

1. From a command prompt on the Campaign server, run the odbctest utility.

   The odbctest utility returns a list of databases that you can connect to, similar to the following:

   Registered Data Sources:
   - MS Access Database (Microsoft Access Driver (*.mdb))
   - dBASE Files (Microsoft dBase Driver (*.dbf))
   - Excel Files (Microsoft Excel Driver (*.xls))

2. The odbctest utility is prompt-driven. You must enter the following information exactly at the prompts:
   a. The name of the database you want to connect to (taken from the list of Registered Data Sources)
   b. A database user ID
   c. The password associated with the database user ID

   The utility does not prompt for confirmation of your selections.

3. When you have successfully connected to the database, the odbctest utility prints out messages like the following and presents you with a command prompt:

   Server ImpactDemo conforms to LEVEL 1.
   Server's cursor commit behavior: CLOSE
   Transactions supported: ALL
   Maximum number of concurrent statements: 0
   For a list of tables, use PRINT.

4. You can enter the following commands at the prompt:
   - `bulk [number_of_records]`
     Sets the number of records to return, as specified by `number_of_records`. The default is 1.
   - `desc res SQL_command`
     Describes the columns returned by the SQL command specified by `SQL_command`.
   - `describe pattern`
     Describes the table or tables specified by `pattern`. Returns the corresponding type, data type, storage length, precision, and scale.
   - `exit`
     Terminates the database connection and exits.
   - `help`
     Displays a list of supported commands.
   - `print[ pattern ]`
     Returns a list of tables. Can optionally specify a search `pattern`.
   - `quit`
     Terminates the database connection and exits.
   - `SQL_command`
     Executes any valid SQL command or series of SQL commands.
   - `typeinfo`
     Returns a list of supported data types for the database.
**db2test utility**

The db2test utility allows you to test connections to a DB2 database and, once connected, to issue a variety of commands.

**To use the db2test utility**

1. From a command prompt on the Campaign server, run the db2test utility.
   - The db2test utility returns a list of databases (registered data sources) that you can connect to.
2. The db2test utility is prompt-driven. You must enter the following information exactly at the prompts:
   - The name of the database you want to connect to (taken from the list of Registered Data Sources)
   - A database user ID
   - The password associated with the database user ID
   - The utility does not prompt for confirmation of your selections.
3. When you have successfully connected to the database, the db2test utility prints out messages like the following and presents you with a command prompt:
   - Server ImpactDemo conforms to LEVEL 1.
   - Server’s cursor commit behavior: CLOSE
   - Transactions supported: ALL
   - Maximum number of concurrent statements: 0
   - For a list of tables, use PRINT.
4. You can enter the following commands at the prompt:
   - `describe pattern`
     - Describes the table or tables specified by `pattern`. Returns the corresponding type, data type, storage length, precision, and scale.
   - `exit`
     - Terminates the database connection and exits.
   - `help`
     - Displays a list of supported commands.
   - `print [pattern]`
     - Returns a list of tables. Can optionally specify a search `pattern`.
   - `quit`
     - Terminates the database connection and exits.
   - `SQL_command`
     -Executes any valid SQL command or series of SQL commands.
   - `typeinfo`
     - Returns a list of supported data types for the database.

**oratest utility**

The oratest utility allows you to test connections to an Oracle server.

**To use the oratest utility**

1. From a command prompt on the Campaign server, run the oratest utility.
2. The oratest utility is prompt driven. You must enter the following information exactly at the prompts:
   - a. The name of the Oracle server you want to connect to
   - b. A database user ID
c. The password associated with the database user ID

The utility does not prompt for confirmation of your selections.

If successful, the oratest utility prints a **Connection Successful** message and exits with a return value of zero (0).

---

**Database load utilities**

Campaign offers support for using database load utilities to increase performance for pushing ID lists into temporary tables, and for exporting data back into the database. This functionality works with most common database load utilities, which are available directly from the database vendors. It is your responsibility to obtain licensed copies of these utilities.

The Campaign load support is controlled though a series of properties defined on the Marketing Platform Configuration page. For more information, see the *Marketing Platform Administrator's Guide*.

When you use most database load utilities, you must also specify a control file. Campaign can generate this file dynamically based on a control file template that you configure. You only need to configure these files once; no changes are required from the user interface.

When Campaign needs to populate data to the database (for example, for a Snapshot process or a contact process such as MailList, or an ID list into temporary tables), it does the following:

1. Creates a temporary data file as fixed width or delimited text.
   - If specified by the `LoaderControlFileTemplate` property, a temporary control file is dynamically created based on the template file and the list of fields that need to be sent to the database.
2. Issues the command specified by the `LoaderCommand` property. This can be either a direct call to the database load utility executable or a call to a script that launches the database load utility.
3. Cleans up the temporary data file and control file.
   - This functionality allows you to load data into a new or empty database table and append data to an existing database table.

**Note:** Campaign does not support using load utilities to update records in an existing database table.

---

**Fast loader repeated tokens**

When you create a `LoaderControlFileTemplate` or a `LoaderControlFileTemplateForAppend`, a list of special tokens is repeated once for each field in the outbound table. The available tokens are described in the following table.

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CONTROLFILE&gt;</code></td>
<td>This token is replaced with the full path and file name to the temporary control file that Campaign generates according to the template that is specified in the <code>LoaderControlFileTemplate</code> parameter.</td>
</tr>
</tbody>
</table>
Table 44. Fast loader repeated tokens (continued)

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DSN&gt;</td>
<td>This token is replaced with the value of the DSN property. If the DSN property is not set, the &lt;DSN&gt; token is replaced by the data source name used in the category name for this data source (the same value used to replace the &lt;DATABASE&gt; token).</td>
</tr>
<tr>
<td>&lt;DATABASE&gt;</td>
<td>This token is replaced with the name of the data source that Campaign is loading data into. This is the same data source name used in the category name for this data source.</td>
</tr>
<tr>
<td>&lt;DATAFILE&gt;</td>
<td>This token is replaced with the full path and file name to the temporary data file created by Campaign during the loading process. This file is in the Campaign Temp directory, UNICA_ACTMPDIR.</td>
</tr>
<tr>
<td>&lt;NUMFIELDS&gt;</td>
<td>This token is replaced with the number of fields in the table.</td>
</tr>
<tr>
<td>&lt;PASSWORD&gt;</td>
<td>This token is replaced with the database password from the current flowchart connection to the data source.</td>
</tr>
<tr>
<td>&lt;TABLE&gt;</td>
<td>This token is obsolete, but is supported for backward compatibility. See &lt;TABLENAME&gt;, which replaced &lt;TABLE&gt; as of version 4.6.3.</td>
</tr>
<tr>
<td>&lt;TABLENAME&gt;</td>
<td>This token is replaced with the database table name that Campaign is loading data into. This is the target table from your Snapshot process or the name of the Temp Table being created by Campaign.</td>
</tr>
<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the database user from the current flowchart connection to the data source.</td>
</tr>
</tbody>
</table>

In addition to these special tokens, every line includes other characters. To include a single character on every line except the last line, the character can be enclosed within angle brackets. You can enclose only a single character between the angle bracket (< >) characters for this functionality.

This is commonly used to separate the list of fields with a comma. For example, the following syntax generates a comma-separated list of field names:

<FIELDNAME><,>

The angle bracket (<>) characters around the comma indicate that the comma should be present on every line, after every inserted field name, except the last.

If any sequence of characters does not fit this requirement, it is repeated every time, including the last. So for example, to generate a parenthesized, comma-separated list of field names in which each field name is preceded by a colon, you can use the following syntax:

```
( :
 :<FIELDNAME><,>
)
```

Because the colon is not enclosed within angle bracket (<>) characters, it repeats for every line; however, the comma appears on every line except the last. It might produce output as follows:
(  
  :FirstName,  
  :LastName,  
  :Address,  
  :City,  
  :State,  
  :ZIP  
)

Note that the comma does not appear after the last field name (ZIP), yet the colon appears before every field name.
Chapter 16. Configuring Campaign for non-ASCII data

Campaign and PredictiveInsight support the use of localized data and non-United States locales, including multiple user-preferred locales within the same installation of the Unica application. To ensure that your application is set up to work correctly with non-ASCII data, non-United States locales, or user-specified locales, you must perform some specific configuration tasks. Unica strongly recommends that you avoid using your Unica applicaton before you have completely configured your system and tested it for your data and locale. It is recommended that you perform these configuration steps on a new installation of the application.

About using non-ASCII data or non-US locales

Before you perform any of the configuration procedures, you should understand the basic concepts as they apply to data and locale configuration in your IBM Unica Marketingapplication. This section includes the following:

- “About character encodings.”
- “About interactions with non-ASCII databases.”
- “About the multi-locale feature” on page 170.

About character encodings

A character encoding is the means by which human language is represented on a computer. Many different encodings are used to represent different languages. In order to configure your Unica application to work with non-ASCII languages, you need to understand the character encodings used to store textual data in both your files and your databases. Special cases in character encoding occur in some text formats. For more details, see “The encoding of text in character-based fields” on page 170.

The supported encodings are listed in “Character encodings in Campaign” on page 323.

About interactions with non-ASCII databases

When an application communicates with a database, several language-sensitive areas must be understood between them, including:

- The format of date and time fields
- The encoding of text in character-based fields
- The sorting order expected in ORDER BY clauses of SQL SELECT statements

Campaign and PredictiveInsight communicate directly with the database client and the client communicates with the database. Each database varies in how it handles language-sensitive data. You must understand the encoding and date format that your database server and client use, and ensure that you configure your Unica application correctly for these settings.

The format of date and time fields

The format of a date field can have various characteristics, including:

- Order of the day, month, and year
- Delimiters between day, month, and year
- Representation of fully-written-out dates
• Type of calendar (Gregorian or Julian)
• Abbreviated and full weekday names
• Abbreviated and full month names

The format of a time field can have various characteristics, including:
• The hour format (for example, 12-hour or 24-hour format)
• The representation of minutes and seconds
• The locale-specific indicator for AM/PM

**Important:** If you use the multi-locale feature, you should not use date formats containing 3-letter months (MMM), %b (abbreviated month name), or %B (full month name). Instead, you should use a delimited or fixed format with a numeric value for the month. For more details about date formats, see “Date and time formats” on page 327. For more details about the multi-locale feature, see “About the multi-locale feature.”

Date and time formats can appear in SQL statements as well as in the data returned by the database (called a resultset). Some database clients support or require different formats between SQL statements (output) and resultsets (input). The Configuration page for Campaign includes a parameter (DateFormat, DateOutputFormatString, DateTimeFormat, and DateTimeOutputFormatString) for each of the different formats.

**The encoding of text in character-based fields**

Data in CHAR, VARCHAR, and other text-based fields have a specific character encoding. When databases are created, they might specify the encoding that will be used throughout the database. Campaign and PredictiveInsight can be configured to use one of many different character encodings on a database-wide scale. Per-column encodings are not supported.

One feature that is common in modern databases is that the database client will transcode between the encoding of the database and the encoding that an application uses. This is common in the case where an application uses some form of Unicode, but the database uses a language-specific encoding.

**About the multi-locale feature**

Campaign supports multiple languages and locales for a single installation. Campaign has a default language and locale which is set during installation, but you can optionally set an individual locale preference for each user in IBM Unica Marketing.

Setting a user’s locale preference is optional. Unless a preferred locale is set explicitly in IBM Unica Marketing for a user, there is no "preferred" locale at the user level, and when that user logs in, Campaign uses the suite-level locale set in IBM Unica Marketing.

When a preferred locale is explicitly set for a user, this preference overrides the suite-level setting, and when this user logs in to Campaign, the user interface appears in the user’s preferred language and locale. This setting applies until the session ends (that is, when the user logs out). Thus, the multi-locale feature allows multiple users to log in to Campaign and work simultaneously, each in their preferred language and locale. For details about setting user locale preferences in IBM Unica Marketing, see the *IBM Unica Marketing Platform Administrator’s Guide.*
To configure your system for multi-locale functionality, see “Configuring Campaign for multiple locales” on page 177. You complete the tasks in that section after configuring Campaign for a non-ASCII language or non-US locale.

**Important:** If you use the multi-locale feature, you should not use date formats containing 3-letter months (MMM), %b (abbreviated month name), or %B (full month name). Instead, use a delimited or fixed format with a numeric value for the month.

**Areas not affected by user locale preferences**
The user locale preference does not control all areas of display in Campaign. The following areas are not affected by user locale preferences:

- Parts of the Campaign interface that do not have a user context (for example, the log in page that appears prior to any user logging in). These parts of the interface are displayed in Campaign’s default language.
- Any user-defined items within the user interface, if they are read from a user database (for example, custom or external attributes) are displayed only in their original database language.
- Data input -- regardless of the locale setting, if your system tables are correctly set up with Unicode encoding, you can input data to Campaign in any language.
- Campaign command line tools -- these display in Campaign’s default language. You can override the Campaign default language with the language specified in your system’s LANG environment variable. If you change the LANG environment variable, the following Campaign programs require a new invocation for the change to take effect:
  - install_license
  - svrstop
  - unica_acls
  - unica_sesutil
  - unica_actrg
  - unica_svradm

**Note:** In Windows, the language and regional settings must match. Regional settings affect all non-Unicode programs in Windows, and must be explicitly set.

**Limitations of the multi-locale feature**
The multi-locale feature has the following limitations:

- It is not supported for Japanese operating systems. To install Campaign with a single locale on a Japanese OS, contact Unica Technical Support.

  **Note:** The multi-locale feature installed on non-Japanese operating system environments does correctly support ja as a user locale preference.

- It is not supported by all Unica applications. See the documentation for each application for information about multi-locale support.

- In multi-locale installations of Campaign, when file names are in mixed languages, or when the command shell language (encoding) does not match the file name encoding, file names might appear garbled in command-line displays.

- Multi-locale installations of Campaign on Windows platforms is supported only on NTFS drives, as FAT32 does not support Unicode character sets.

- Cell Profile Reports are not localized and remain in English regardless of locale.
Configuring Campaign for a non-ASCII language or a non-US locale

To configure Campaign for localized data or non-ASCII locales, first read all of “About using non-ASCII data or non-US locales” on page 169. Then, complete the tasks in the following list. Each step is described in detail later in this section.

1. “Set the operating system language and regional settings.”
2. “Set encoding parameters for the web application server (WebSphere only)” on page 173.
3. “Set Campaign language and locale property values” on page 173.
4. “Un-map and re-map system tables” on page 174.

Important: Do not skip any of the tasks or steps. Skipping a step could result in incorrect or incomplete configuration, causing errors or corrupted data.

Set the operating system language and regional settings
On the server running the Campaign Sever and the system where the Campaign web application is deployed, configure the operating system language and regional settings.

Note: Your database might also require that you set the operating system language and locale on the machine where the database is installed. See the database documentation to determine whether this is required.

About setting the language and locale on UNIX
UNIX systems require that appropriate languages are installed. To determine if the desired language is supported on an AIX, HP, or Solaris machine, use this command:

```bash
# locale -a
```

The command returns all supported locales on the system. Note that Campaign does not require that you install support for X Fonts and translations.

If the language you need is not yet installed, use the information from the following sources to configure supported UNIX variants to work with a given language:

- Solaris 9 International Language Environments Guide (http://docs.sun.com/app/docs/doc/806-6642)

About setting the language and locale on Windows
If the regional and language options on a Windows system are not yet configured for the language you need, do so now. If you need information about Windows language settings, see http://www.microsoft.com/globaldev/handson/user/xpintl1supp.mspx

You might need your system installation CD to complete this task.
Note: Be sure to restart the Windows system after you change the language settings.

**Set encoding parameters for the web application server (WebSphere only)**

For WebSphere® only, if you are using Campaign with a non-ASCII encoding, you must set -Dclient.encoding.override=UTF-8 as a JVM argument to ensure that the application server uses UCS Transformation Format for encoding.

For detailed instructions on doing this, see the IBM WebSphere documentation.

**Set Campaign language and locale property values**

Use Marketing Platform to set the values of configuration parameters that control how Campaign performs the following tasks:

- reads and writes data in text files and log files
- reads and writes date, time, and text fields within the database
- handles text it receives from the database.

The configuration of the Campaign web application determines the language and locale used both for translated Campaign messages (for example, text in the Campaign user interface) as well as the format of dates, numbers, and currency symbols on the application’s web pages. It is also vital for allowing flowcharts to display non-ASCII text, because the display language is used to initialize the flowchart editor.

**Note:** Campaign supports non-ASCII column names, table names, and database names; however, it supports NCHAR, NVARCHAR, etc. columns on SQL Server databases only. On DB2, NCHAR and NVARCHAR format columns are treated as if they were regular text fields; on Oracle, they are treated as numeric fields.

Log in to Marketing Platform and configure the following properties. Record these values for future reference. For information about these properties, see the *Campaign Installation Guide*.

- Campaign > currencyLocale
- Campaign > supportedLocales
- Campaign > defaultLocale
- Campaign > partitions > partition[n] > dataSources > [data_source_name] > DateFormat
- Campaign > partitions > partition[n] > dataSources > [data_source_name] > DateOutputFormatString
- Campaign > partitions > partition[n] > dataSources > [data_source_name] > DateTimeFormat
- Campaign > partitions > partition[n] > dataSources > [data_source_name] > DateTimeOutputFormatString
- Campaign > partitions > partition[n] > dataSources > [data_source_name] > EnableSelectOrderBy
- Campaign > partitions > partition[n] > dataSources > [data_source_name] > ODBCunicode
- Campaign > partitions > partition[n] > dataSources > [data_source_name] > StringEncoding
Un-map and re-map system tables

If any language-sensitive parameter is not set correctly, it can be difficult to configure system tables when you map them in the Administration area of Campaign. The best practice is to set all parameters, then unmap ALL tables in the data source, log out, log in again, and then map all the tables again. Campaign retains its existing settings for a data source until the data source is no longer used (that is, until it is unmapped).

Test your database and server configurations

Before you start creating campaigns or other objects, you should ensure that your database and server settings are correctly configured.

Perform the following tests to ensure that your configurations are correct:

- “Test the database configuration”
- “Test that your attribute table is correctly configured”
- “Test campaigns and flowcharts that have ASCII and non-ASCII characters” on page 175
- “Test flowchart input and output that contains ASCII and non-ASCII characters” on page 175
- “Test that the correct language directory is used” on page 176
- “Test the date formats in calendar reports” on page 176
- “Test that the currency symbol displays correctly for your locale” on page 177

Test the database configuration

1. Select Settings > Campaign Settings. The Campaign Settings page appears.
2. Select View Datasource Access.
3. In the Database Sources dialog, select your data source name.
   The data source details are displayed, including the database type and its configuration settings.
4. Scroll down to the StringEncoding property, and verify that the value is the same as the value you set for dataSources > StringEncoding on the Marketing Platform Configuration page.
5. If the encoding is not as expected, remap your database tables and perform this test again.

Test that your attribute table is correctly configured

1. Select Settings > Campaign Settings.
   The Campaign Settings page appears.
2. Select Manage Table Mappings
3. In the Table Mappings dialog, in the list of Unica system tables, select the Attribute Definition Table (UA_AttributeDef) and click Browse.
4. In the **Attribute Definition Table** window, verify that non-ASCII characters display correctly.

**Test campaigns and flowcharts that have ASCII and non-ASCII characters**

1. In Campaign, create a campaign using the following guidelines:
   - Use only ASCII characters for the names, but use non-ASCII characters in other fields, such as the **Description** and **Objective** fields.
   - The default dates displayed in the **Effective/Expiration Dates** fields should appear in your locale's date format. Select new dates for each of the **Effective/Expiration Dates** fields using the Calendar Tool, making sure that you select a day greater than “12” so that it will be obvious if the day is incorrectly represented as the month.
   - Verify that the dates you selected using the Calendar Tool are displayed correctly in the fields.
   - If there are custom campaign attributes existing, the field labels for these should appear in your database encoding, regardless of your default locale or user locale.
2. When you are finished with the basic campaign fields, click **Save and Add a Flowchart**.
3. Accept the default flowchart name, but use non-ASCII characters in the **Flowchart Description** field.
4. Click **Save and Edit Flowchart**.
5. Verify that the campaign and flowchart are saved successfully and any campaign and flowchart labels with non-ASCII characters display correctly.
6. On the campaign’s Summary tab, click **Edit** and modify the campaign name to use non-ASCII characters.
7. Click **Save Changes** and verify that the non-ASCII characters display correctly.
8. Select the flowchart you just created, click **Edit** and rename the flowchart using non-ASCII characters.
9. Click **Save Changes** and verify that the non-ASCII characters display correctly.

**Test flowchart input and output that contains ASCII and non-ASCII characters**

1. Still in the test flowchart you created in “Test campaigns and flowcharts that have ASCII and non-ASCII characters,” click **Edit**.
2. Add a Select process to the flowchart and configure it using the following guidelines:
   - In the **Input** field, select a mapped user table. The available fields from the selected table are displayed in the **Available Fields** area.
   - Select a field that you know contains non-ASCII characters, and click **Profile**.
   - Verify that the non-ASCII characters display correctly.
3. In the same Select process configuration, do another test, this time using a flat file with non-ASCII characters as the input:
   - In the **Input** field, select a select a flat file that uses non-ASCII characters. The available fields from the selected file are displayed in the **Available Fields** area.
   - Verify that the non-ASCII characters display correctly.
4. On the **General** tab of the **Select Process Configuration** window, replace the default name in the **Process Name** field with a name containing non-ASCII characters, then click **OK**.

5. Verify that the non-ASCII process name displays correctly on the process.

6. Add a Snapshot process to the flowchart and connect it so that it takes input from the existing Select process.

7. Configure the Snapshot process to **Export to** file.

8. Run the **Select > Snapshot** flowchart and locate the specified output file.

9. Verify that the output looks correct.

10. Add a Schedule process to the flowchart and configure a custom run:
   - In the **Process Configuration** window, select **Custom Run** from the **Schedule to Run** field.
   - Use the **Calendar** to specify a date and time. For the date, choose a day greater than “12” so that it will be obvious if the day is incorrectly represented as the month.
   - Remember to click **Apply**, then click **OK** to save the date and time before closing the Calendar Tool.

11. Verify that the date and time are displayed correctly in the **Run On Time** field.

12. Close the Process Configuration window and click **Save and Exit**.

13. Select **Settings > Campaign Settings**.
   The Campaign Settings page appears.

14. Select **Manage Table Mappings**.

15. In the Table Mappings window, in the list of Unica system tables, select the `UA_Campaign` table and click **Browse**.

16. In the Campaign Table window, verify that non-ASCII characters display correctly.

17. In the Table Mapping window, select the `UA_Flowchart` table and verify that non-ASCII characters display correctly.

18. When you successfully complete this test, delete the test campaigns and their flowcharts, and any files that you used for testing.

**Test that the correct language directory is used**

1. In Campaign, select **Analysis > Calendar Reports > Calendar of Campaigns**. The Calendar of Campaigns appears. Notice that the time delineation selector that appears vertically to the right of the report (day/week/2 week/month) is an image.

2. Right-click the image and select **Properties**.

3. In the Properties window for the image, examine the Address (URL) for the image.
   - For example, the Address might be:
     ```
     http://localhost:7001/Campaign/de/images/calendar_nav7.gif
     ```
   indicating that the language and locale setting is German (de).

4. Verify that the language and locale setting matches either your default application setting or your user locale preference (if any).

**Test the date formats in calendar reports**

1. In Campaign, click **Analysis > Calendar Reports > Calendar of Campaigns**.

2. Click through the **Day**, **Week**, **2 Week**, and **Month** tabs on the right to verify that the date formats in this report are correct.

**Test that the currency symbol displays correctly for your locale**

1. Select **Settings > Campaign Settings**.  
   The Campaign Settings window appears.
2. Select **Offer Template Definitions**.
3. Create a new and on the New Offer Template (Step 2 of 3) page, select **Cost Per Offer** from the **Available Standard and Custom Attributes** list, and move it to the **Selected Attributes** list.
4. Click **Next** and on the New Offer Template (Step 3 of 3) page, examine the **Cost Per Offer** attribute field under **Parameterized Attributes**. Verify that the currency symbol appearing in parentheses is correct for your locale.
5. When you complete this test successfully, click **Cancel** because you don’t need to create the offer template.

---

**Configuring Campaign for multiple locales**

Configuring Campaign for more than one locale requires you to configure the system tables to support more than one locale. First, you run the appropriate unicode version of the database creation scripts when creating the system tables. Then you configure certain encoding properties, date and time formats, environment variables, and so on, depending on your database type.

**Before you begin: Campaign must be installed**

The information in the rest of this section is presented under the assumption that Campaign is already installed AND that the Campaign system tables were created with the unicode version of the database creation script appropriate for your database type. The unicode versions are located in the `<CAMPAIGN_HOME>\ddl\unicode` directory.

**Configuring for multiple locales on SQL**

Log in to IBM Unica Marketing and configure the encoding properties listed in the following table. Set the values for the properties as specified here.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; dataSources &gt; [data_source_name] &gt; StringEncoding</td>
<td>WIDEUTF-8</td>
</tr>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; server &gt; encoding &gt; stringEncoding</td>
<td>UTF-8</td>
</tr>
<tr>
<td>Campaign &gt; unicaACLlistener &gt; logStringEncoding</td>
<td>UTF-8</td>
</tr>
<tr>
<td>Campaign &gt; unicaACLlistener &gt;systemStringEncoding</td>
<td>UTF-8. If necessary, you can set more than one encoding, separated by commas, but keep UTF-8 first in the series. For example: for example, UTF-8,ISO-8859-1,CP950.</td>
</tr>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; dataSources &gt; [data_source_name] &gt; ODBCunicode</td>
<td>UCS-2</td>
</tr>
</tbody>
</table>
For the configuration properties that specify date and time formats, accept the default values.

**Configuring for multiple locales on Oracle**

When configuring for multiple locales and your system tables are Oracle, you configure encoding properties, date/time settings, environment variables, and the startup script for the Campaign Listener.

**Configure encoding properties (Oracle)**

Log in to Marketing Platform and configure the encoding properties listed in the following table. Set the values for the properties as specified here.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; dataSources &gt; [data_source_name] &gt; StringEncoding</td>
<td>UTF-8</td>
</tr>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; server &gt; encoding &gt; stringEncoding</td>
<td>UTF-8</td>
</tr>
<tr>
<td>Campaign &gt; unicaACListener &gt; logStringEncoding</td>
<td>UTF-8</td>
</tr>
<tr>
<td>Campaign &gt; unicaACListener &gt; systemStringEncoding</td>
<td>UTF-8</td>
</tr>
</tbody>
</table>

**Configure date/time settings (Oracle)**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; [data_source_name] &gt; DateFormat</td>
<td>DELIM_Y_M_D</td>
</tr>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; [data_source_name] &gt; DateOutputFormatString</td>
<td>%Y-%m-%d</td>
</tr>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; [data_source_name] &gt; DateTimeFormat</td>
<td>DT_DELIM_Y_M_D</td>
</tr>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; [data_source_name] &gt; DateTimeOutputFormatString</td>
<td>%Y-%m-%d %H:%M:%S</td>
</tr>
<tr>
<td>For Japanese databases, the delimiter for the time portion must be a period (.) So, for Japanese databases set the value to:</td>
<td>%Y/%m/%d %H.%M.%S</td>
</tr>
</tbody>
</table>

**Configure environment variables (Oracle)**

On Campaign client machines, set the value for the NLS_LANG variable as follows:

AMERICAN_AMERICA.UTF8

For example:

set NLS_LANG=AMERICAN_AMERICA.UTF8
Configure the cmpServer.bat file (Oracle)

On the Campaign client machines, modify the Campaign Listener startup script as follows:

For Windows

Add the following line to the cmpServer.bat file, located in the <CAMPAIGN_HOME>/bin directory:

set NLS_LANG=AMERICAN_AMERICA.UTF8

For UNIX

Add the following lines to the rc.unica_ac file, located in the <CAMPAIGN_HOME>/bin directory:

NLS_LANG=AMERICAN_AMERICA.UTF8
export NLS_LANG

(The syntax will vary depending on operating system).

Configuring for multiple locales on DB2

When configuring for multiple locales and your system tables are DB2, you configure encoding properties, date/ time settings, environment variables, and the startup script for the application server.

Configure encoding properties (DB2)

Log in to Marketing Platform and configure the encoding properties listed in the following table. Set the values for the properties as specified here.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; dataSources &gt; [data_source_name] &gt; StringEncoding</td>
<td>UTF-8</td>
</tr>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; server &gt; encoding &gt; stringEncoding</td>
<td>UTF-8</td>
</tr>
<tr>
<td>Campaign &gt; unicaACListener &gt; logStringEncoding</td>
<td>UTF-8</td>
</tr>
<tr>
<td>Campaign &gt; unicaACListener &gt; systemStringEncoding</td>
<td>UTF-8</td>
</tr>
</tbody>
</table>

Configure date/time settings (DB2)

On the Marketing Platform Configuration page, set the following values for the following date/time properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; [data_source_name] &gt; DateOutputFormatString</td>
<td>%Y-%m-%d</td>
</tr>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; [data_source_name] &gt; DateTimeFormat</td>
<td>DT_DELIM_Y_M_D</td>
</tr>
<tr>
<td>Property</td>
<td>Value</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>-------</td>
</tr>
<tr>
<td>Campaign &gt; partitions &gt; partition[n] &gt; [data_source_name] &gt; DateTimeOutputFormatString</td>
<td>%Y-%m-%d %H:%M:%S</td>
</tr>
</tbody>
</table>

For Japanese databases, the delimiter for the time portion must be a period (.) So, for Japanese databases set the value to:

%Y/%m/%d %H.%M.%S

### Configure environment variables (DB2)

On Campaign client machines, set the value for the DB2CODEPAGE variable as follows:

Set the DB2CODEPAGE environment variable to the following value: 1208

For example:

```bash
db2set DB2CODEPAGE=1208
```

In addition, the DB2 data source must be created using the UTF-8 character set.

### Configure application server startup scripts (DB2)

If you set the code page variable as described in “Configure environment variables (DB2),” complete the following task. If you did not, the following modification is not required.

Modify your startup script for Weblogic or WebSphere, adding the following under JAVA_OPTIONS:

```
-Dfile.encoding=utf-8
```

For example:

```bash
${JAVA_HOME}/bin/java ${JAVA_VM} ${MEM_ARGS} ${JAVA_OPTIONS}
-Dfile.encoding=utf-8 -Dweblogic.Name=${SERVER_NAME}
-Dweblogic.ProductionModeEnabled=${PRODUCTION_MODE}
-Djava.security.policy="${WL_HOME}/server/lib/weblogic.policy" weblogic.Server
```
Appendix A. Configuration properties on the configuration page

This section describes the configuration properties found on the Configuration page.

Marketing Platform configuration properties

This section describes the Marketing Platform configuration properties on the Configuration page.

General | Navigation

TCP port for secure connections

Description
Specifies the SSL port in the web application server on which the Marketing Platform is deployed. This property is used internally for communication among IBM products.

Default value
7001

TCP port for standard connections

Description
Specifies the HTTP port in the web application server on which the Marketing Platform is deployed. This property is used internally for communication among IBM products.

Default value
7001

Unica URL

Description
Specifies the URL used for the IBM Unica Marketing. This is set at installation time and normally should not be changed. Note that the URL contains the domain name, as shown in the following example.

protocol://machine_name_or_IP_address.domain_name:port_number/context-root

The machine name should not be localhost.

Default value
Not defined

Example
In an environment configured for SSL, the URL might look like this:

https://machineName.companyDomain.com:8080/customer/unica
**General | Data filtering**

**Default table name**

*Description*

In conjunction with Default audience name, determines the set of data filters (that is, the data configuration) from which the data filter user interface in IBM Unica Marketing reads filters and assignments.

*Default value*

Undefined

*Valid Values*

Physical name of the customer table that contains the fields used as data filter criteria. Maximum of 50 characters of type varchar.

**Default audience name**

*Description*

In conjunction with Default table name, determines the set of data filters (that is, the data configuration) from which the data filter user interface in IBM Unica Marketing reads filters and assignments.

*Default value*

Undefined

*Valid Values*

When configuring data filters for Distributed Marketing, the name must be the same as the name given to an audience level in Campaign. Maximum of 50 characters of type varchar.

**General | Password settings**

Properties in this category specify the policies that apply to IBM Unica Marketing passwords. Most of these password options apply only to passwords for internal users (created within the Marketing Platform), not to external users (imported from an external system). The exception is the Maximum failed login attempts allowed property, which affects both internal and external users. Also note that this property does not override any similar restriction set in an external system.

**Maximum failed login attempts allowed**

*Description*

Specifies the maximum number of times an invalid password may be entered each time a user logs in. If the maximum is reached, the user is disabled in the IBM Unica Marketing system, and no one can log in as that user.

If set to zero or less, the system allows an infinite number of consecutive failures.

*Default value*

3

*Valid Values*

Any integer
Password history count

Description
Specifies the number of old passwords the system retains for a user. The user is not allowed to reuse any passwords within this list of old passwords. If the value is set to zero or less, then no history is retained, and the user may reuse the same password repeatedly. Note that the password history count does not include the password initially assigned to a user account when it is created.

Default value
0

Valid Values
Any integer

Validity (in days)

Description
Specifies the number of days before a user’s password expires.
If the value is zero or less, then the password never expires.
If the value is greater than zero, users are required to change their password the first time they log in, and the expiration interval is counted from the date of the first login.
If you change this value after users and passwords have been created, the new expiration date takes effect for existing users the next time they change their password.

Default value
30

Valid Values
Any integer

Blank passwords allowed

Description
Specifies whether the a blank password is allowed. If you set this to true you should also set Minimum character length=0.

Default value
true

Valid Values
true | false

Allow identical user name and password

Description
Specifies whether the user’s password is allowed to be the same as the user’s login name.

Default value
false
Valid Values
  true | false

**Minimum number of letter characters**

Description
  Specifies the minimum number of letters required in a password. If the value is zero or less, then there is no minimum requirement.

Default value
  0

Valid Values
  Any integer

**Minimum number of numeric characters**

Description
  Specifies the minimum number of numbers required in a password. If the value is zero or less, then there is no minimum requirement.

Default value
  0

Valid Values
  Any integer

**Minimum character length**

Description
  Specifies the minimum length of a password. If the value is zero or less, then there is no minimum requirement. If you set the value to greater than 0, you should also set Blank passwords allowed=false.

Default value
  4

Valid Values
  Any integer

**General | Miscellaneous**

Properties in this category specify values that are used internally, as well as a value you may need to set for the locale.

**TokenLifetime**

Description
  Specifies the length of time, in seconds, that a token generated by the Marketing Platform is valid. It is part of the suite sign-on implementation, and you should not change this value.

Default value
  15

Valid Values
Any positive integer

**Default region**

**Description**

Specifies the default locale for the Marketing Platform. If you plan to install Campaign, you should set this value to match the locale set for Campaign in Campaign’s `defaultLocale` property.

**Default value**

en_US

**Valid Values**

Supported locales

**Trusted application enabled**

**Description**

When this value is set to True, the Marketing Platform must be deployed in an environment that has an SSL port and the Unica URL property in the General > Navigation category must be set to use https.

**Default value**

False

**Valid Values**

True | False

**Platform**

**Region setting**

**Description**

Specifies the locale preference for IBM Unica Marketing users. When you set this property on the Configuration page, the setting you apply is the default setting throughout IBM Unica Marketing for all users, except those whose locale preference is set individually through the Marketing Platform’s User page. When you set this property for an individual user, the setting you apply for that user overrides the default setting.

This preference setting affects display of the language, time, numbers, and dates in IBM Unica Marketing applications.

Availability of locales may vary depending on the IBM Unica Marketing application, and not all IBM Unica applications support this locale setting in the Marketing Platform. See specific product documentation to determine availability and support for the Region setting property.

**Default value**

English (United States)

**Help server**

**Description**

The URL of the server on which IBM Unica hosted online help is installed. If IBM Unica Marketing users have internet access, you should not change the default value, which points to the online help server maintained and updated by IBM Unica.
Default value
The URL of the hosted help server.

Valid Values
Any server on which IBM Unica hosted help is installed.

Unica Marketing Operations - Campaign integration
Description
A flag indicating whether Marketing Operations and Campaign are installed together and integrated. See the Marketing Operations documentation for complete details on configuring this integration.

Default value
False

Valid Values
True | False

Unica Marketing Operations - Offer integration
Description
Set this property to True when you want to use the new Marketing Object offer introduced in version 8.5.0. To use the older method of offer integration, retain the default value of False. Applies only when the IBM Unica Marketing Operations Campaign integration property is set to True.

Default value
False

Valid Values
True | False

Start page
Description
The URL of the page that appears when users log in to IBM Unica Marketing. The default is the default dashboard.

Default value
The default dashboard.

Valid Values
Any IBM Unica Marketing URL except form submissions pages, edit pages, and search result pages.

Domain name
Description
The name of the domain where IBM Unica Marketing is installed. The value is set during installation. You should not change this unless the domain name changes.

Default value
Not defined
**Disable Page Tagging**

**Description**
When set to the default value of `False`, IBM Unica uses the Site ID code that was entered during Marketing Platform installation to gather basic statistics that track overall product usage trends to develop and improve IBM Unica products. If you do not want to have such information collected, set this property to `True`.

**Default value**
`False`

**Valid Values**
`True` | `False`

---

**Platform | Scheduler**

**Client polling interval**

**Description**
Campaign polls the IBM Scheduler for jobs at regular intervals, specified in milliseconds by this value. The default value is 60 seconds. You should not set this property to any value less than 10000 (10 seconds), because this can decrease campaign performance.

**Default value**
`60000`

---

**Client initialization delay**

**Description**
The amount of time, expressed in milliseconds, that the Campaign scheduler thread waits before polling the IBM Scheduler for jobs when Campaign first starts up. Set this value to be at least as long as it takes for Campaign to fully start up on your system. The default value is five minutes.

**Default value**
`300000`

**Valid Values**
Any integer

---

**Platform | Scheduler | Recurrence definitions**

Properties in this category set the recurrence patterns for the IBM Scheduler. These appear in the dialog box you use if you set a recurrence pattern when you create a schedule. You can use the Recurrence template to create your own recurrence pattern, using any valid Cron expression.

**Every hour**

**Description**
The job is triggered every hour.

**Default value**
`0 0 0/1 * * ?`
**Every day**

Description

The job is triggered every 24 hours.

Default value

`0 0 0 * * ?`

**Every [day of week] at 12:00 am**

Description

The job is triggered on the specified day of the week at 12:00 am.

Default value

- Monday - `0 0 0 ? * MON`
- Tuesday - `0 0 0 ? * TUE`
- Wednesday - `0 0 0 ? * WED`
- Thursday - `0 0 0 ? * THU`
- Friday - `0 0 0 ? * FRI`
- Saturday - `0 0 0 ? * SAT`
- Sunday - `0 0 0 ? * SUN`

**[First|Last] day of every month at 12:00 am**

Description

The job is triggered on the specified day of the month (first or last) at 12:00 am.

Default value

- First day of every month - `0 0 0 1 * ?`
- Last day of every month - `0 0 0 L * ?`

**[First|Last] day of every quarter at 12:00 am**

Description

The job is triggered on the specified day of the calendar quarter (first or last day) at 12:00 am.

Default value

- First day of every quarter - `0 0 0 1 * JAN,APR,JUL,OCT`
- Last day of every quarter - `0 0 0 L * MAR,JUN,SEP,DEC`

**[First|Last] day of every year at 12:00 am**

Description

The job is triggered on the specified day of the year (first or last) at 12:00 am.

Default value

- First day of every year - `0 0 0 1 ? JAN *
- Last day of every year - `0 0 0 L ? DEC *`
Every [month] at 12:00 am

Description
The job is triggered on the first day of the specified month at 12:00 am.

Default value
- Every January - 0 0 0 1 ? JAN *
- Every February - 0 0 0 1 ? FEB *
- Every March - 0 0 0 1 ? MAR *
- Every April - 0 0 0 1 ? APR *
- Every May - 0 0 0 1 ? MAY *
- Every June - 0 0 0 1 ? JUN *
- Every July - 0 0 0 1 ? JUL *
- Every August - 0 0 0 1 ? AUG *
- Every September - 0 0 0 1 ? SEP *
- Every October - 0 0 0 1 ? OCT *
- Every November - 0 0 0 1 ? NOV *
- Every December - 0 0 0 1 ? DEC *

Platform | Scheduler | Schedule registrations | Campaign |
[Object type]

A different category exists for each of the two object types that can be scheduled with the IBM scheduler: flowchart and mailing. Properties in these categories should not normally be changed.

Executor class name

Description
The class that the IBM Scheduler uses to trigger a flowchart or mailing run.

Default value
- Mailing - com.unicacorp.Campaign.controller.mailing.MailingExecutorImpl

Status polling interval

Description
At regular intervals, the IBM Scheduler polls Campaign for the run status of scheduled objects (flowchart or mailing) that have not reported status. The interval is specified here in milliseconds. The default value is 10 minutes. Setting a more frequent polling interval (a smaller value) affects the system performance. Setting a less frequent polling interval (a larger value) reduces the load on the system, and is recommended if there are a large number of flowcharts that take more than 10 minutes to complete.

Default value
600000
Default throttling groups exist for each of the two object types that can be scheduled with the scheduler flowchart and mailing. You can use the Throttling group template to create additional groups.

**Throttling threshold**

**Description**

The greatest number of schedules associated with this group that can run concurrently. The configured scheduler groups appear in the Scheduler Group drop-down list in the Scheduler user interface for creating and editing schedules. The default throttling group is set to 999, which is effectively no limit. Because all schedules must belong to a throttling group, you should leave this value unchanged so that schedules that you do not want to throttle can be assigned to this group.

**Default value**

- Default throttling group - 999
- Group created from a template - Not defined

**Valid Values**

Any positive integer.

**Platform | Security**

**Login method**

**Description**

Specifies the authentication mode for all IBM Unica Marketing products installed and configured to work together, as follows:

- If you set the value to Windows integrated login, IBM Unica Marketing products use Windows Active Directory for authentication.
- If you set the value to Unica Marketing Platform, IBM Unica Marketing products use the Marketing Platform for authentication and authorization.
- If you set the value to LDAP, IBM Unica Marketing products use an LDAP server for authentication.
- If you set the value to Web access control, IBM Unica Marketing products use web access control software for authentication.

**Default value**

Unica Marketing Platform

**Valid Values**

Windows integrated login | Unica Marketing Platform | LDAP | Web access control

**Platform | Security | Login method details | Windows integrated login**

**Domain**

**Description**
Sets the value of JCIFS SMB client library property `jcifs.smb.client.Domain`. Specifies the domain that is used if no domain is specified in an SMB URL. Set this value to the Windows domain name. For most environments, set either this property or the Domain Controller property.

Default value
Undefined.

Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory server and Windows integrated login is enabled.

**Client Timeout**

Description
Sets the value of JCIFS SMB client library property `jcifs.smb.client.soTimeout`. Specifies the amount of time, in milliseconds, before sockets are closed if there is no activity between the client and server. This number should be as small as possible but long enough to allow the protocol handshaking to complete, which depends on network characteristics.

Default value
1000

Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory server and Windows integrated login is enabled.

**Cache Policy**

Description
Sets the value of JCIFS SMB client library property `jcifs.netbios.cachePolicy`. Specifies the amount of time, in seconds, that the NetBIOS name is cached to reduce redundant name queries. If the value is set to 0 no caching takes place. If the value is set to -1 the cache is never cleared. This property is used when SMB signing is enabled and required in a Windows 2003 domain.

Default value
0

Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory server and Windows integrated login is enabled.

**Domain Controller**

Description
Sets the value of JCIFS SMB client library property `jcifs.http.domainController`. Specifies the IP address of a server that should be used to authenticate HTTP clients (used by NtlmHttpFilter and...
NetworkExplorer). You may use the IP address of a workstation in the
domain specified in the Domain property. For most environments, set either
this property or the Domain property.

Default value
Undefined.

Availability
This property is used only when the Marketing Platform is configured to
integrate with a Windows Active Directory server and Windows integrated
login is enabled.

IP of the WINS server

Description
Sets the value of JCIFS SMB client library property jcifs.netbios.wins.
Specifies the IP address of the WINS server. You may enter multiple IP
addresses, separated by commas (for example 192.168.100.30,
192.168.100.31). The WINS server is queried to resolve the domain
specified in the Domain property to an IP address of a domain controller.
This property is required when accessing hosts on different subnet (such as
a domain controller by name) and it is highly recommended if a WINS
server is available.

Default value
Undefined

Availability
This property is used only when the Marketing Platform is configured to
integrate with a Windows Active Directory server and Windows integrated
login is enabled and Windows integrated login is enabled.

Strip Domain

Description
Specifies whether the Marketing Platform removes a domain from users'
login names when they access the IBM Unica Marketing. If your Windows
configuration requires a domain to be included with users' login names
when they log in, set this value to False.

Default value
True

Valid Values
True | False

Availability
This property is used only when the Marketing Platform is configured to
integrate with a Windows Active Directory server and Windows integrated
login is enabled.

Retry on Authentication Failure

Description
If a user login fails, the system allows another login attempt if this value is set to True. Set to False if you want to disallow more than one login attempt.

Default value
True

Valid Values
True | False

Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory server and Windows integrated login is enabled.

**Platform | Security | Login method details | LDAP**

**LDAP server host name**

Description
Specifies the name or IP address of the LDAP server. Set the value to the machine name or IP address of the LDAP server. For example:
machineName.companyDomain.com

If you are integrating with Windows Active Directory, use the server name instead of the DNS name.

Default value
Undefined

Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**LDAP server port**

Description
Specifies the port on which the LDAP server listens. Set the value to the appropriate port number. Typically, the port number is 389 (636 if SSL is used).

Default value
389

Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**User search filter**

Description
Specifies the filter to use to search for users. Valid values are any valid LDAP search filter (see RFC 2254). Note that you must XML-escape any XML characters in this value.

Typically, the value for the user login attribute is uid for LDAP servers and sAMAccountName for Windows Active Directory servers. You should verify
this on your LDAP or Active Directory server. If your LDAP server is Windows Active Directory, you should change the default value of this property to use `sAMAccountName` rather than `uid`. For example:

```
(&(|(objectClass=user)(objectClass=person))(sAMAccountName={0}))
```

**Default value**

```
(&(|(objectClass=user)(objectClass=person))(uid={0}))
```

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

### Use credentials stored in Unica

**Description**

Specifies whether the Marketing Platform uses credentials from the Marketing Platform database when searching the LDAP or Windows Active Directory server during user authentication (at login time).

If this value is `true`, the Marketing Platform uses credentials from the Marketing Platform database, and you must set the appropriate values for the Unica user for LDAP credentials and Data source for LDAP credentials properties in this category.

If your LDAP or Windows Active Directory server does not allow anonymous access, set this value to `true`.

If this value is `false`, the Marketing Platform connects with the LDAP or Windows Active Directory server anonymously. You may set this value to `false` if your LDAP or Windows Active Directory server allows anonymous access.

**Default value**

`false`

**Valid Values**

`true` | `false`

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

### Unica user for LDAP credentials

**Description**

Specifies the name of the IBM Unica Marketing user that has been given LDAP administrator login credentials. Set this value if you set the Use credentials stored in Unica property in this category to `true`.

Set the value of this property to the user name you created for the IBM Unica Marketing user when you configured LDAP integration. This property works in conjunction with the Data source for LDAP credentials property in this category.

**Default value**

`asm_admin`

**Availability**
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**Data source for LDAP credentials**

**Description**

Specifies the Marketing Platform data source for LDAP administrator credentials. Set this value if you set the Use credentials stored in Unica property in this category to true.

Set the value of this property to the data source name you created for the IBM Unica Marketing user when you configured LDAP integration. This property works in conjunction with the Unica user for LDAP credentials property in this category.

**Default value**

Undefined

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**Base DN**

**Description**

Specifies the base distinguishing name (DN) pointing to the root of the LDAP directory structure.

**Default value**

[CHANGE ME]

**Valid Values**

Any valid DN (see RFC 1779, RFC 2253)

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**Require SSL for LDAP connection**

**Path**

Platform | Security | LDAP

**Description**

Specifies whether the Marketing Platform uses SSL when it connects to the LDAP server to authenticate users. If you set the value to true, the connection is secured using SSL.

**Default value**

false

**Valid Values**

true | false
Platform | Security | Login method details | Web access control

**Username pattern**

**Description**
Java regular expression used to extract the user login from the HTTP header variable in web access control software. Note that you must XML-escape any XML characters in the regular expression. The recommended value for SiteMinder and Tivoli® Access Manager is `\w*`

**Default value**
Undefined

**Valid Values**
Any Java regular expression.

**Availability**
This property is used only when the Marketing Platform is configured to integrate with web access control software.

**Web access control header variable**

**Description**
Specifies the HTTP header variable configured in the web access control software, which is submitted to the web application server. By default, SiteMinder uses `sm_user` and Tivoli Access Manager (TAM) uses `iv-user`. For TAM, set this value to the user name component of the IBM Raw string, not the IBM HTTP string.

**Default value**
Undefined

**Valid Values**
Any string

**Availability**
This property is used only when the Marketing Platform is configured to integrate with web access control software.

Platform | Security | Login method details | LDAP synchronization

**LDAP sync enabled**

**Description**
Set to true to enable LDAP or Active Directory synchronization.

**Default value**
false

**Valid Values**
true | false

**Availability**
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**LDAP sync interval**

**Description**

The Marketing Platform synchronizes with the LDAP or Active Directory server at regular intervals, specified in seconds here. If the value is zero or less, the Marketing Platform does not synchronize. If the value is a positive integer, the new value takes effect without a restart within ten minutes. Subsequent changes take effect within the configured interval time.

**Default value**

600, or ten minutes

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**LDAP sync delay**

**Description**

This the time (in 24 hour format) after which the periodic synchronization with the LDAP server begins, after the Marketing Platform is started. For example an LDAP sync delay of 23:00 and an LDAP sync interval of 600 mean that when the Marketing Platform starts, the periodic synchronization starts to execute at 11:00 PM and executes every 10 minutes (600 seconds) thereafter.

**Default value**

23:00, or 11:00pm

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**LDAP sync timeout**

**Description**

The LDAP sync timeout property specifies the maximum length of time, in minutes, after the start of a synchronization before the Marketing Platform marks the process ended. The Platform allows only one synchronization process to run at a time. If a synchronization fails, it is marked as ended whether it completed successfully or not.

This is most useful in a clustered environment. For example, if the Marketing Platform is deployed in a cluster, one server in the cluster might start an LDAP synchronization and then go down before the process is marked as ended. In that case, the Marketing Platform will wait for the amount of time specified in this property, and then it will start the next scheduled synchronization.

**Default value**

600, (600 minutes, or ten hours)

**Availability**
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**LDAP sync scope**

**Description**

Controls the scope of the initial query to retrieve the set of users. You should retain the default value of `SUBTREE` for synchronizing with most LDAP servers.

**Default value**

`SUBTREE`

**Valid Values**

The values are standard LDAP search scope terms.

- `OBJECT` - Search only the entry at the base DN, resulting in only that entry being returned
- `ONE_LEVEL` - Search all entries one level under the base DN, but not including the base DN..
- `SUBTREE` - Search all entries at all levels under and including the specified base DN..

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**LDAP provider URL**

**Description**

For most implementations, set to the LDAP URL of the LDAP or Active Directory server, in one of the following forms:

- `ldap://IP_address:port_number`
- `ldap://machineName.domain.com:port_number`

On LDAP servers, the port number is typically 389 (636 if SSL is used).

If IBM Unica Marketing is integrated with an Active Directory server, and your Active Directory implementation uses serverless bind, set the value of this property to the URL for your Active Directory server, using the following form:

`ldap://dc=example,dc=com`

**Default value**

Undefined

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.
Require SSL for LDAP connection

Path
Platform | Security | LDAP synchronization

Description
Specifies whether the Marketing Platform uses SSL when it connects to the LDAP server to synchronize users. If you set the value to true, the connection is secured using SSL.

Default value
false

Valid Values
ture | false

Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

LDAP config Unica group delimiter

Description
In the LDAP reference to Unica group map category, if you want to map one LDAP or Active Directory group to multiple Marketing Platform groups, use the delimiter specified here. It can be any single character that does not appear in the names it is separating.

Default value
; (semicolon)

Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

LDAP reference config delimiter

Description
Specifies the delimiter that separates the SEARCHBASE and FILTER components that make up the LDAP or Active Directory reference (described in the LDAP references for Unica user creation category).

FILTER is optional: if omitted, the Marketing Platform server dynamically creates the filter based on the value of LDAP user reference attribute name.

Default value
; (semicolon)

Valid Values
Any single character that does not appear in the names it is separating.

Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.
Unica user for LDAP credentials

Description

Specifies the name of IBM Unica Marketing user that has been given LDAP administrator login credentials.

Set the value of this property to the user name you created for the IBM Unica Marketing user when you configured LDAP integration. This property works in conjunction with the Data source for LDAP credentials property in this category.

Default value

asm_admin

Availability

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

Data source for LDAP credentials

Description

Specifies the Marketing Platform data source for LDAP administrator credentials.

Set the value of this property to the data source name you created for the IBM Unica Marketing user when you configured LDAP integration. This property works in conjunction with the Unica user for LDAP credentials property in this category.

Default value

Undefined

Availability

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

LDAP user reference attribute name

Description

Specifies the name that your LDAP or Active Directory server uses for the user attribute in the Group object. Typically, this value is uniquemember in LDAP servers and member in Windows Active Directory servers.

If you omit the FILTER reference in the LDAP references for AM user creation and LDAP references to AM group map sections, the Marketing Platform server dynamically creates the filter based on this value, so you should verify this on your LDAP or Active Directory server.

Default value

member

Availability

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

User login

Description
Maps the IBM Unica Marketing user's login to the equivalent user attribute in your LDAP or Active Directory server. **User login** is the only required mapping. Typically, the value for this attribute is **uid** for LDAP servers and **samAccountName** for Windows Active Directory servers. You should verify this on your LDAP or Active Directory server.

**Default value**

**uid**

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

### First name

**Description**

Maps the First Name user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.

**Default value**

**givenName**

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

### Last name

**Description**

Maps the Last Name user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.

**Default value**

**sn**

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

### User title

**Description**

Maps the Title user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.

**Default value**

**title**

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

### Department

**Description**

Maps the Department user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.

**Default value**

Undefined

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**Company**

**Description**

Maps the Company user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.

**Default value**

Undefined

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**Country**

**Description**

Maps the Country user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.

**Default value**

Undefined

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**User email**

**Description**

Maps the Email Address attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.

**Default value**

mail

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**Address 1**

**Description**

Maps the Address user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.

**Default value**

Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

Work phone
Description
Maps the Work Phone user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.
Default value
undefined
Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

Mobile phone
Description
Maps the Mobile Phone user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.
Default value
undefined
Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

Home phone
Description
Maps the Home Phone user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.
Default value
undefined
Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

Alternate login
Description
Maps the Alternate Login user attribute in the Marketing Platform to the equivalent user attribute in your LDAP or Active Directory server.
Default value
undefined
Availability
This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

</table>

**Description**

Users who are members of the LDAP or Active Directory group specified here are imported to the Marketing Platform group specified in the Unica group property.

Set the value of this property using the following syntax: SEARCHBASE

DELIMITER FILTER where:

SEARCHBASE is the Distinguished Name (DN) of the object.

DELIMITER is the value of the LDAP config AM group delimiter property.

FILTER is the LDAP or Active Directory attribute filter. FILTER is optional: if omitted, the Marketing Platform server dynamically creates the filter based on the value of the LDAP user reference attribute name property.

**Default value**

Undefined

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

**Unica group**

**Description**

Users who are members of the LDAP or Active Directory group specified in the LDAP reference group property are imported to the Marketing Platform group specified here.

**Default value**

Undefined

**Availability**

This property is used only when the Marketing Platform is configured to integrate with a Windows Active Directory or other LDAP server.

---

**Reporting configuration properties**

For reporting, the IBM Unica Marketing suite integrates with IBM Cognos, a third-party business intelligence application. You use the Cognos properties to identify the IBM Cognos system used by your IBM Unica installation. Then, for Campaign, eMessage, and Interact, there are additional configuration properties that you use to set up and customize reporting schemas.

**Reports | Integrations | Cognos 8**

This page displays properties that specify URLs and other parameters for the IBM Cognos 8 BI system used by this IBM Unica system.
Integration Name

Description
Read-only. Specifies that IBM Cognos 8 BI is the third-party reporting or analytical tool used by the IBM Unica Marketing to display the reports.

Default value
Cognos 8

Vendor

Description
Read-only. Specifies that IBM Cognos is the name of the company that provides the application specified by the Integration Name property.

Default value
Cognos

Version

Description
Read-only. Specifies the product version of the application specified by the Integration Name property.

Default value
8.4

Enabled

Description
Specifies whether IBM Cognos 8 BI is enabled for the suite.

Default value
False

Valid Values
True | False

Integration Class Name

Description
Read-only. Specifies the fully-qualified name of the Java class that creates the integration interface used to connect to the application specified by the Integration Name property.

Default value
com.unica.report.integration.cognos.CognosIntegration

Domain

Description
Specifies the fully-qualified company domain name in which your Cognos server is running. For example, myCompanyDomain.com.

If your company uses subdomains, the value in this field must include the appropriate subdomain as well.
Portal URL
Description
Specifies the URL of the IBM Cognos Connection portal. Use a fully qualified host name, including the domain name (and subdomain, if appropriate) that is specified in the Domain property. For example:
You can find the URL in IBM Cognos Configuration at: Local Configuration > Environment.

Default value
http://[CHANGE ME]/cognos8/cgi-bin/cognos.cgi

Valid Values
A well-formed URL.

Dispatch URL
Description
Specifies the URL of the IBM Cognos Content Manager. Use a fully qualified host name, including the domain name (and subdomain, if appropriate) specified in the Domain property. For example:
You can find the URL in Cognos Configuration at: Local Configuration > Environment.

Default value
http://[CHANGE ME]:9300/p2pd/servlet/dispatch

Note that 9300 is the default port number for the Cognos Content Manager. Be sure that the port number specified matches that used in the Cognos installation.

Valid Values
A well-formed URL.

Authentication mode
Description
Specifies whether the IBM Cognos application is using the IBM Unica Authentication Provider, which means it relies on the Marketing Platform for authentication.

Default value
anonymous

Valid Values
anonymous: means authentication is disabled.
authenticated: means that the communications between the IBM Unica system and the IBM Cognos system are secured at the machine level. You configure a single system user and configure it with the appropriate access rights. By convention, this user is named "cognos_admin."

authenticatedPerUser: means that the system evaluates individual user credentials.

### Authentication namespace

**Description**

Read only. The namespace of the IBM Unica Authentication Provider.

**Default value**

Unica

### Authentication user name

**Description**

Specifies the login name for the reporting system user. The IBM Cognos 8 BI applications log in as this user when IBM Cognos 8 BI is configured to use the Authentication Provider. Note that this user also has access to IBM Unica Marketing.

**Default value**

cognos_admin

### Authentication datasource name

**Description**

Specifies the name of the data source for the reporting system user that holds the Cognos login credentials.

**Default value**

Cognos

### Enable form authentication

**Description**

Specifies whether form-based authentication is enabled. You set this property to True when either of the following is true:

- When the IBM Unica Marketing is not installed in the same domain as the IBM Cognos applications.
- When IBM Cognos is accessed using an IP address (within the same network domain) instead of the Fully Qualified Hostname (which is being used to access the IBM Unica Marketing applications), even if both the IBM Unica Marketing applications and the IBM Cognos installation are on the same machine.

However, when the value is True, the login process to Cognos Connection passes the login name and password in clear text and therefore is not secure unless IBM Cognos and the IBM Unica Marketing are configured to use SSL communication.
Even with SSL configured, the user name and password appear as clear text in the HTML source code when you “view source” in a displayed report. For this reason, you should install IBM Cognos and IBM Unica Marketing in the same domain.

Default value
False

Valid Values
True | False

Reports | Schemas | [product] | [schema name] | SQL
Configuration

Table/View Name

Description
Specifies the name of the view or table that the SQL script you generate for this reporting schema will create. As a best practice, you should not change the name for any of the standard or default Table/View names. If you do, you must also change the name of the view in the Cognos model in IBM Cognos Framework Manager.

When you create a new reporting schema for a new audience level, you must specify the names of all the new reporting tables/views.

Default value
Varies by schema

Valid Values
A string with the following restrictions.
- It can be no longer than 18 characters
- It must use all UPPER-CASE letters

Following is the naming convention you should use:
- Start the name with the letter "UAR"
- Add a one-letter code to represent the IBM Unica application. See the list of codes, below.
- Add an underscore character
- Add the table name, including a one or two letter code to indicate the audience level
- Finish with an underscore character.

The SQL generator appends a time dimension code, if appropriate. See the list of codes, below.

For example: UARC_COPERF_DY is the name of the reporting view or table for Campaign Offer Performance by Day.

Following is the list of IBM Unica application codes.
- Campaign: C
- eMessage: E
- Interact: I
- Distributed Marketing: X
- Marketing Operations: P
• Leads: L

Following is the list of the Time Dimension Codes added by the generator.
• Hour: HR
• Day: DY
• Week: WK
• Month: MO
• Quarter: QU
• Year: YR

Reports | Schemas | Campaign

Input Datasource (JNDI)

Description

Specifies the name of the JNDI data source that identifies the Campaign
database, specifically, the system tables. This data source must exist if you
want to use the SQL generation tool to generate scripts that create
reporting tables. The SQL generation tool can generate scripts that create
reporting views without this data source, but it cannot validate them.

The database type of this data source must match the database type you
select when you generate the SQL scripts for the Campaign views or
reporting tables.

Default value
campaignPartitionIDS

Reports | Schemas | Campaign | Offer Performance

The Offer Performance Schema yields contact and response history metrics for all
offers and for offers by campaign. By default, the schema is configured to generate
a “summary” view (or table) across all time.

Audience Key

Description

Specifies the name of the column that is the Audience Key for the audience
level supported by this reporting schema.

Default value
CustomerID

Valid Values

A string value no longer than 255 characters

If the key includes more than one column, use commas between the
column names. For example, ColumnX,ColumnY.

Contact History Table

Description

Specifies the name of the Contact History table for the audience level
supported by this reporting schema.

Default value
UA_ContactHistory

**Detailed Contact History Table**

**Description**
Specifies the name of the Detailed Contact History table for the audience level supported by this reporting schema.

**Default value**
UA_DtlContactHist

**Response History Table**

**Description**
Specifies the name of the Response History table for the audience level supported by this reporting schema.

**Default value**
UA_ResponseHistory

**Over Time Variations**

**Description**
Specifies the calendar time periods used by the "over time" reports supported by this schema.

**Default value**
Day, Month

**Valid Values**
Day, Week, Month, Quarter, Year

---

Report \| Schema \| Campaign \| [schema name] \| Columns \| [Contact Metric]

Use this form to add contact metrics to the Campaign Performance or Offer Performance reporting schemas.

**Column Name**

**Description**
Specifies the name to use in the reporting view or table for the column specified in the Input Column Name field.

**Default value**
[CHANGE ME]

**Valid Values**
The name can be no longer than 18 characters, it must be in all UPPER-CASE letters, and it cannot have spaces.

**Function**

**Description**
Specifies how the contact metric is determined or calculated.
Default value
  count
Valid Values
  count, count distinct, sum, min, max, average

**Input Column Name**

**Description**
The name of the column that provides the contact metric you are adding to this reporting schema.

**Default value**
  [CHANGE ME]

**Valid Values**
The name of the column in the Contact History and Detailed Contact History tables.

**Control Treatment Flag**

**Description**
If you use the sample IBM Cognos reports or create your own custom reports that include control groups, then each contact metric must have two columns in the reporting schema. One column represents the metric for the control group and the other column represents the metric for the target group. The value in Control Treatment Flag specifies whether the column in the view represents the control group or the target group.

If your reports do not include control groups, you do not need the second column for the control group.

**Default value**
  0

**Valid Values**
  • 0: the column represents the target group
  • 1: the column represents the control group

**Reports | Schemas | Campaign | [schema name] | Columns | [Response Metric]**

Use this form to add the response metrics you want to include in your reports to the Campaign Performance or Offer Performance reporting schemas.

**Column Name**

**Description**
Specify the name to use in the reporting view or table for the column specified in the Input Column Name field.

**Default value**
  [CHANGE ME]

**Valid Values**
The name can be no longer than 18 characters, it must be in all UPPERCASE letters, and it cannot have spaces.

**Function**

**Description**

Specifies how the response metric is determined or calculated.

**Default value**

count

**Valid Values**

count, count distinct, sum, min, max, average

**Input Column Name**

**Description**

The name of the column that provides the response metric you are adding to this reporting schema.

**Default value**

[CHANGE ME]

**Valid Values**

The name of the column in the Response History table.

**Control Treatment Flag**

**Description**

If you use the standard IBM Cognos reports or create your own custom reports that include control groups, then each response metric must have two columns in the reporting schema. One column represents the response from the control group and the other column represents the response from the target group. The value in **Control Treatment Flag** specifies whether the column in the view represents the control group or the target group.

If your reports do not include control groups, you do not need the second column for the control group.

**Default value**

0

**Valid Values**

- 0: the column represents the target group
- 1: the column represents the control group

**Reports | Schemas | Campaign | Performance**

The Campaign Performance schema yields contact and response history metrics at the campaign, campaign-offer, and campaign-cell level.

**Audience Key**

**Description**

Specifies the name of the column that is the Audience Key for the audience level supported by this reporting schema.
Default value

CustomerID

Valid Values

A string value no longer than 255 characters

If the key includes more than one column, use commas between the column names. For example, ColumnX,ColumnY.

**Contact History Table**

**Description**

Specifies the name of the Contact History table for the audience level supported by this reporting schema.

Default value

UA_ContactHistory

**Detailed Contact History Table**

**Description**

Specifies the name of the Detailed Contact History table for the audience level supported by this reporting schema.

Default value

UA_DtlContactHist

**Response History Table**

**Description**

Specifies the name of the Response History table for the audience level supported by this reporting schema.

Default value

UA_ResponseHistory

**Over Time Variations**

**Description**

Specifies the calendar time periods used by the "over time" reports supported by this schema.

Default value

Day, Month

**Valid Values**

Day, Week, Month, Quarter, Year

**Reports | Schemas | Campaign | Offer Response Breakout**

This schema supports reporting on campaign-detailed responses, broken out by response type and by offer data. This schema template gives different response counts for each custom Response Type for campaigns and offers grouped by campaign.
**Response History Table**

**Description**  
Specifies the name of the Response History table for the audience level supported by this reporting schema.

**Default value**  
UA_ResponseHistory

## Reports | Schemas | Campaign | Offer Response Breakout | [Response Type]

Use this form to add to the reporting schema any custom response types you want to include in your reports.

### Column Name

**Description**  
Specifies the name to use in the reporting view or table for the column specified in the **Response Type Code** field.

**Default value**  
[CHANGE ME]

**Valid Values**  
The name can be no longer than 18 characters, it must be in all UPPER-CASE letters, and it cannot have spaces.

### Response Type Code

**Description**  
The response type code for the specified response type. This is the value held in the **ResponseTypeCode** column in the UA_UsrResponseType table.

**Default value**  
[CHANGE ME]

**Valid Values**  
The example response type codes are as follows:

- EXP (explore)
- CON (consider)
- CMT (commit)
- FFL (fulfill)
- USE (use)
- USB (unsubscribe)
- UKN (unknown)

Your Campaign installation may have additional custom response type codes.

### Control Treatment Flag

**Description**
If you use the standard IBM Cognos reports provided in the IBM Unica Reports Pack or custom reports that include control groups, then each response type must have two columns in the reporting schema. One column represents the response type from the control group and the other column represents the response type from the target group. The value in Control Treatment Flag specifies whether the column in the view represents the control group or the target group.

If your reports do not include control groups, you do not need the second column for the control group.

Default value

0

Valid Values

- 0: the column represents the target group
- 1: the column represents the control group

**Reports | Schemas | Campaign | Campaign Offer Contact Status Breakout**

This schema supports reporting on campaign-detailed contacts, broken out by contact status type and by offer data. This schema template gives different contact counts for each custom Contact Status Type for campaigns and offers grouped by campaign.

By default, none of the example Campaign reports use this schema.

**Audience Key**

Description

Specifies the name of the column that is the Audience Key for the audience level supported by this reporting schema.

Default value

CustomerID

Valid Values

A string value no longer than 255 characters

If the key includes more than one column, use commas between the column names. For example, ColumnX,ColumnY.

**Contact History Table**

Description

Specifies the name of the Contact History table for the audience level supported by this reporting schema.

Default value

UA_ContactHistory

**Detailed Contact History Table**

Description
Specifies the name of the Detailed Contact History table for the audience level supported by this reporting schema.

**Default value**

UA_DtlContactHist

### Reports | Schemas | Campaign | Campaign Offer Contact Status Breakout | [Contact Status Code]

#### Column Name

**Description**

Specifies the name to use in the reporting view or table for the column specified in the Contact Status field.

**Default value**

[CHANGE ME]

**Valid Values**

The name can be no longer than 18 characters, it must be in all UPPER-CASE letters, and it cannot have spaces.

### Contact Status

**Description**

The name of the contact status code. This is the value held in the ContactStatusCode column in the UA_ContactStatus table.

**Default value**

[CHANGE ME]

**Valid Values**

The example contact status types are as follows.

- CSD (campaign send)
- DLV (delivered)
- UNDLV (undelivered)
- CTR (control)

Your Campaign installation may have additional custom contact status types.

### Reports | Schemas | Campaign | Custom Attributes | Columns | [Campaign Custom Column]

Use this form to add to the reporting schema any custom campaign attributes that you want to include in your reports.

#### Column Name

**Description**

Specifies the name to use in the reporting view or table for the attribute identified in the Attribute ID field.

**Default value**

[CHANGE ME]
Valid Values
The name can be no longer than 18 characters, it must be in all
UPPER-CASE letters, and it cannot have spaces.

Attribute ID
Description
The value from the attribute's AttributeID column in the
UA_CampAttribute table.
Default value
0

Value Type
Description
The data type of the campaign attribute.
Default value
StringValue
Valid Values
StringValue, NumberValue, DatetimeValue
If this campaign attribute holds a currency value, select NumberValue.
If this campaign attribute's Form Element Type was set to Select Box -
String in Campaign, select StringValue.

Reports | Schemas | Campaign | Custom Attributes | Columns
I [Offer Custom Column]

Use this form to add to the reporting schema any custom offer attributes that you
want to include in your reports.

Column Name
Description
Specifies the name to use in the reporting view or table for the attribute
identified in the Attribute ID field.
Default value
[CHANGE ME]
Valid Values
The name can be no longer than 18 characters, it must be in all
UPPER-CASE letters, and it cannot have spaces.

Attribute ID
Description
The value from the attribute's AttributeID column in the
UA_OfferAttribute table.
Default value
0

Appendix A. Configuration properties on the configuration page 217
**Value Type**

**Description**

The data type of the offer attribute.

**Default value**

StringValue

**Valid Values**

StringValue, NumberValue, DatetimeValue

If this offer attribute holds a currency value, select NumberValue.

If this offer attribute's **Form Element Type** was set to Select Box - String in Campaign, select StringValue.

---

**Reports | Schemas | Campaign | Custom Attributes | Columns | [Cell Custom Column]**

Use this form to add to the reporting schema any custom cell attributes that you want to include in your reports.

**Column Name**

**Description**

Specifies the name to use in the reporting view or table for the attribute identified in the **Attribute ID** field.

**Default value**

[CHANGE ME]

**Valid Values**

The name can be no longer than 18 characters, it must be in all UPPER-CASE letters, and it cannot have spaces.

**Attribute ID**

**Description**

The value from the attribute's AttributeID column in the UA_CellAttribute table.

**Default value**

0

**Value Type**

**Description**

The data type of the cell attribute.

**Default value**

StringValue

**Valid Values**

StringValue, NumberValue, DatetimeValue
The Interact reporting schemas reference three separate databases: the design time, run time, and learning databases. Use the properties from this page to specify the JNDI names of the data sources for those databases.

The data sources specified on this page must exist if you want to use the Reporting SQL generation tool to generate scripts that create reporting tables. The SQL generation tool can generate scripts that create reporting views without these data sources, but it cannot validate the scripts.

Note that the database type of the data sources must match the database type you select when you generate the SQL scripts for the views or reporting tables.

**Interact Design Datasource (JNDI)**

**Description**

Specifies the name of the JNDI data source that identifies the Interact design time database, which is also the Campaign system tables.

**Default value**

campaignPartition1DS

**Interact Runtime Datasource (JNDI)**

**Description**

Specifies the name of the JNDI data source that identifies the Interact runtime database.

**Default value**

InteractRTDS

**Interact Learning Datasource (JNDI)**

**Description**

Specifies the name of the JNDI data source that identifies the Interact learning database.

**Default value**

InteractLearningDS

The Interact Performance schema yields contact and response history metrics at the channel, channel-offer, channel-segment, channel-interaction point, interactive cell, interactive cell-offer, interactive cell-interaction point, interactive offer, interactive offer-cell and interactive offer-interaction point levels.

**Audience Key**

**Description**

Specifies the name of the column that is the Audience Key for the audience level supported by this reporting schema.

**Default value**
CustomerID

Valid Values

A string value no longer than 255 characters.

If the key includes more than one column, use commas between the column names. For example, ColumnX,ColumnY.

Detailed Contact History Table

Description

Specifies the name of the Detailed Contact History table for the audience level supported by this reporting schema.

Default value

UA_DtlContactHist

Response History Table

Description

Specifies the name of the Response History table for the audience level supported by this reporting schema.

Default value

UA_ResponseHistory

Over Time Variations

Description

Specifies the calendar time periods used by the "over time" reports supported by this schema.

Default value

Hour, Day

Valid Values

Hour, Day, Week, Month, Quarter, Year

Reports | Schemas | eMessage

eMessage Tracking Datasource (JNDI)

Description

Specifies the name of the JNDI data source that identifies the eMessage tracking tables, which are located in the Campaign system tables. This data source must exist if you want to use the Reports SQL generation tool to validate scripts that create reporting tables. The SQL generation tool can generate scripts that create reporting views without this data source, but it cannot validate them.

The database type of this data source must match the database type you select when you generate the SQL scripts for the views or reporting tables.

Default value

campaignPartition1DS
This section describes the Campaign configuration properties found on the Configuration page.

**Campaign**

These configuration properties specify the component applications and locales that your installation of Campaign supports.

**currencyLocale**

**Description**

The `currencyLocale` property is a global setting that controls how currency is displayed in the Campaign web application, regardless of the display locale.

**Important:** No currency conversion is performed by Campaign when the display locale changes (for example, if the multi-locale feature is implemented and the display locale changes based on user-specific locales).

You must be aware that when a locale is switched, for example, from English US, in which a currency amount is, for example, US$10.00, to a French locale, the currency amount is unchanged (10,00) even if the currency symbol changes with the locale.

**Default value**

en_US

**supportedLocales**

**Description**

The `supportedLocales` property specifies the locales or language-locale pairs that Campaign supports. The value of this property is set by the installer when you install Campaign.

**Default value**

All languages/locales into which Campaign has been localized.

**defaultLocale**

**Description**

The `defaultLocale` property specifies which of the locales specified in the `supportedLocales` property is considered the default display locale for Campaign. The value of this property is set by the installer when you install Campaign.

**Default value**

en

**acoInstalled**

**Path**

**Description**

The `acoInstalled` property specifies whether Optimize is installed.
When Optimize is installed and configured, set the value to yes, which causes the Optimize process to be displayed in flowcharts. If the value is true and Optimize is not installed or configured, the process is displayed but disabled (grayed out).

**Default value**

false

**Valid Values**

false and true

**collaborateInstalled**

**Description**

The `collaborateInstalled` property specifies whether Distributed Marketing is installed. When Distributed Marketing is installed and configured, set the value to true, which causes the Distributed Marketing features to be available in the Campaign user interface.

**Default value**

false

**Valid Values**

true | false

**Campaign | Collaborate**

The properties in this category pertain to Distributed Marketing configuration.

**CollaborateIntegrationServicesURL**

**Description**

The `CollaborateIntegrationServicesURL` property specifies the server and port number of Distributed Marketing. This URL is used by Campaign when a user publishes a flowchart to Distributed Marketing.

**Default value**

http://localhost:7001/collaborate/services/
CollaborateIntegrationServices/1.0

**Campaign | navigation**

Some of the properties in this category are used internally and should not be changed.

**welcomePageURI**

**Description**

The `welcomePageURI` property is used internally by IBM applications. It specifies the Uniform Resource Identifier of the Campaign index page. You should not change this value.

**Default value**

No default value defined.
**seedName**

Description
The `seedName` property is used internally by IBM applications. You should not change this value.

Default value
No default value defined.

**type**

Description
The `Campaign > navigation > type` property is used internally by IBM applications. You should not change this value.

Default value
No default value defined.

**httpPort**

Description
This property specifies the port used by the Campaign web application server. If your installation of Campaign uses a port that is different from the default, you must edit the value of this property.

Default value
7001

**httpsPort**

Description
If SSL is configured, this property specifies the port used by the Campaign web application server for secure connections. If your installation of Campaign uses a secure port that is different from the default, you must edit the value of this property.

Default value
7001

**serverURL**

Description
The `Campaign > navigation > serverURL` property specifies the URL used by Campaign. If your installation of Campaign has a URL that is different from the default, you should edit the value as follows:

`http://machine_name_or_IP_address:port_number/context-root`

Default value
`http://localhost:7001/Campaign`

**serverURLInternal**

Path

Description

Appendix A. Configuration properties on the configuration page 223
The `serverURLInternal` property specifies the URL for the Campaign web application when SiteMinder is used. If the property is empty, the value in the `serverURL` property is used. If you use SiteMinder, you must set this value to the URL for the Campaign web application server, formatted as follows:

http://machine_name_or_IP_address:port_number/context-root

**Default value**

No default value defined.

**campaignDetailPageURI**

**Description**

The `campaignDetailPageURI` property is used internally by IBM applications. It specifies the Uniform Resource Identifier of the Campaign detail page. You should not change this value.

**Default value**

campaignDetails.do?id=

**flowchartDetailPageURI**

**Description**

The `flowchartDetailPageURI` property is used to construct a URL to navigate to the details of a flowchart in a specific campaign. You should not change this value.

**Default value**

flowchartDetails.do?campaignID=&id=

**offerDetailPageURI**

**Description**

The `offerDetailPageURI` property is used to construct a URL to navigate to the details of a specific offer. You should not change this value.

**Default value**

offerDetails.do?id=

**offerlistDetailPageURI**

**Description**

The `offerlistDetailPageURI` property is used to construct a URL to navigate to the details of a specific offer list. You should not change this value.

**Default value**

displayOfferList.do?offerListId=

**displayName**

**Description**

The `displayName` property specifies the link text used for the Campaign link in the drop-down menu that exists in the GUI of each IBM product.

**Default value**
Campaign

Campaign I caching

The properties in the caching category specify the length of time that cached data for channels, initiatives, campaigns, sessions, and offers is retained.

**offerTemplateDataTTLSeconds**

**Description**

The `offerTemplateDataTTLSeconds` property specifies the length of time, in seconds, that the system retains the Offer Template cache data (Time to Live). An empty value means the cache data is never purged.

**Default value**

600 (10 minutes)

**campaignDataTTLSeconds**

**Description**

The `campaignDataTTLSeconds` property specifies the length of time, in seconds, that the system retains the Campaign cache data (Time to Live). An empty value means the cache data is never purged.

**Default value**

600 (10 minutes)

**sessionDataTTLSeconds**

**Description**

The `sessionDataTTLSeconds` property specifies the length of time, in seconds, that the system retains the Session cache data (Time to Live). An empty value means the cache data is never purged.

**Default value**

600 (10 minutes)

**folderTreeDataTTLSeconds**

**Description**

The `folderTreeDataTTLSeconds` property specifies the length of time, in seconds, that the system retains the Folder Tree cache data (Time to Live). An empty value means the cache data is never purged.

**Default value**

600 (10 minutes)

**attributeDataTTLSeconds**

**Description**

The `attributeDataTTLSeconds` property specifies the length of time, in seconds, that the system retains the Offer Attribute cache data (Time to Live). An empty value means the cache data is never purged.

**Default value**

600 (10 minutes)
initiativeDataTTLSeconds
Description
The initiativeDataTTLSeconds property specifies the length of time, in seconds, that the system retains the Initiative cache data (Time to Live). An empty value means the cache data is never purged.

Default value
600 (10 minutes)

offerDataTTLSeconds
Description
The offerDataTTLSeconds property specifies the length of time, in seconds, that the system retains the Offer cache data (Time to Live). An empty value means the cache data is never purged.

Default value
600 (10 minutes)

segmentDataTTLSeconds
Description
The segmentDataTTLSeconds property specifies the length of time, in seconds, that the system retains the Segment cache data (Time to Live). An empty value means the cache data is never purged.

Default value
600 (10 minutes)

Campaign | partitions
This category contains properties used to configure all Campaign partitions, including the default partition, which is named partition1. One category should be created for each Campaign partition. This section describes the properties in the partition[n] category, which apply to all partitions you configure in Campaign.

Campaign | partitions | partition[n] | eMessage
Properties in this category allow you to define characteristics of recipient lists and specify the location of resources that upload the lists to IBM Unica Hosted Services.

eMessagePluginJarFile
Description
Complete path to the location of the file that operates as the Recipient List Uploader (RLU). This plug-in to Campaign uploads OLT data and associated metadata to the remote services hosted by IBM. The location you specify must be the full local directory path in the file system for the machine that hosts the Campaign web application server.

The IBM installer populates this setting automatically for the default partition when you run the installer. For additional partitions, you must
configure this property manually. Because there is only one RLU for each
eMessage installation, all partitions must specify the same location for the
RLU.

Do not change this setting unless IBM instructs you to do so.

Default value
No default value defined.

Valid Values
Full local directory path to the machine where you installed the Campaign
web server.

defaultSeedInterval
Description
The number of messages between seed messages if defaultSeedType is
Distribute list.

Default value
1000

defaultSeedType
Description
The default method that eMessage uses to insert seed addresses into a
recipient list.

Default value
Distribute IDS

Valid Values
- Distribute IDS - Distribute IDs evenly, based on the size of the recipient
  list and the number of seed addresses available, inserts seed addresses at
equal intervals throughout the entire recipient list.
- Distribute list - Insert seed address for every defaultSeedInterval
  IDs in main list. Inserts the entire list of available seed addresses at
  specified intervals throughout the recipient list. You must specify the
  interval between insertion points.

oltTableNamePrefix
Description
Used in the generated schema for the output list table. You must define
this parameter.

Default value
OLT

Valid Values
The prefix can contain no more than 8 alphanumeric or underscore
characters, and must start with a letter.

oltDimTableSupport
Description
This configuration parameter controls the ability to add dimension tables to output list tables (OLT) created in the eMessage schema. Dimension tables are required to use advanced scripting for email to create data tables in email messages.

The default setting is False. You must set this property to True so that marketers can create dimension tables when they use the eMessage process to define a recipient list. For more information about creating data tables and using advanced scripts for email, see the IBM Unica eMessage User's Guide.

Default value
False

Valid Values
True | False

Campaign | partitions | partition[n] | reports

These configuration properties define folders for reports.

**offerAnalysisTabCachedFolder**

**Description**

The offerAnalysisTabCachedFolder property specifies the location of the folder that contains the specification for bursted (expanded) offer reports listed on the Analysis tab when you reach it by clicking the Analysis link on the navigation pane. The path is specified using XPath notation.

Default value

```
/content/folder[@name='Affinium Campaign - Object Specific Reports']/folder[@name='offer']/folder[@name='cached']
```

**segmentAnalysisTabOnDemandFolder**

**Description**

The segmentAnalysisTabOnDemandFolder property specifies the location of the folder that contains the segment reports listed on the Analysis tab of a segment. The path is specified using XPath notation.

Default value

```
/content/folder[@name='Affinium Campaign - Object Specific Reports']/folder[@name='segment']/folder[@name='cached']
```

**offerAnalysisTabOnDemandFolder**

**Description**

The offerAnalysisTabOnDemandFolder property specifies the location of the folder that contains the offer reports listed on the Analysis tab of an offer. The path is specified using XPath notation.

Default value

```
/content/folder[@name='Affinium Campaign - Object Specific Reports']/folder[@name='offer']
```
segmentAnalysisTabCachedFolder

Description
The segmentAnalysisTabCachedFolder property specifies the location of the folder that contains the specification for bursted (expanded) segment reports listed on the Analysis tab when you reach it by clicking the Analysis link on the navigation pane. The path is specified using XPath notation.

Default value
/content/folder[@name='Affinium Campaign - Object Specific Reports']/folder[@name='segment']

analysisSectionFolder

Description
The analysisSectionFolder property specifies the location of the root folder where report specifications are stored. The path is specified using XPath notation.

Default value
/content/folder[@name='Affinium Campaign']

campaignAnalysisTabOnDemandFolder

Description
The campaignAnalysisTabOnDemandFolder property specifies the location of the folder that contains the campaign reports listed on the Analysis tab of a campaign. The path is specified using XPath notation.

Default value
/content/folder[@name='Affinium Campaign - Object Specific Reports']/folder[@name='campaign']

campaignAnalysisTabCachedFolder

Description
The campaignAnalysisTabCachedFolder property specifies the location of the folder that contains the specification for bursted (expanded) campaign reports listed on the Analysis tab when you reach it by clicking the Analysis link on the navigation pane. The path is specified using XPath notation.

Default value
/content/folder[@name='Affinium Campaign - Object Specific Reports']/folder[@name='campaign']/folder[@name='cached']

campaignAnalysisTabEmessageOnDemandFolder

Description
The campaignAnalysisTabEmessageOnDemandFolder property specifies the location of the folder that contains the eMessage reports listed on the Analysis tab of a campaign. The path is specified using XPath notation.

Default value
campaignAnalysisTabInteractOnDemandFolder

Description
Report server folder string for Interact reports.

Default value
/content/folder[@name='Affinium Campaign']/folder[@name='Interact Reports']

Availability
This property is applicable only if you have installed Interact.

interactiveChannelAnalysisTabOnDemandFolder

Description
Report server folder string for Interactive Channel analysis tab reports.

Default value
/content/folder[@name='Affinium Campaign - Object Specific Reports']/folder[@name='interactive channel']

Availability
This property is applicable only if you have installed Interact.

Campaign | partition[n] | validation

The Validation Plugin Development Kit (PDK), delivered with Campaign, allows third parties to develop custom validation logic for use in Campaign. Properties in the partition[n] > validation category specify the classpath and class name of the custom validation program, and an optional configuration string.

validationClass

Description
The validationClass property specifies the name of the class used for validation in Campaign. The path to the class is specified in the validationClasspath property. The class must be fully qualified with its package name.

For example:
com.unica.campaign.core.validation.samples.SimpleCampaignValidator

indicates the SimpleCampaignValidator class from the sample code.

This property is undefined by default, which causes Campaign to perform no custom validation.

Default value
No default value defined.

validationConfigString

Description
The `validationConfigString` property specifies a configuration string that is passed into the validation plugin when Campaign loads it. The use of the configuration string may vary, depending on the plugin used.

This property is undefined by default.

**Default value**

No default value defined.

**validationClasspath**

**Description**

The `validationClasspath` property specifies the path to the class used for custom validation in Campaign.

You may specify the path as follows:

- The value may be either full path or a relative path. If the path is not an absolute path, the behavior depends on the application server that is running Campaign. WebLogic uses the path to the domain work directory which by default is `c:\bea\user_projects\domains\mydomain.

- If the path ends in a slash (forward slash `/` for UNIX or backslash `\` for Windows), then Campaign assumes the path is to a directory that contains the Java plug-in class that should be used. If the path does not end in a slash, then Campaign assumes that it is the name of a jar file that contains the java class. For example: The value `/opt/affinium/campaign/pdk/lib/validation.jar` is the path on a UNIX platform that would point to the jar file that comes out of the box with the plug-in developer kit.

This property is undefined by default, which causes the property to be ignored.

**Default value**

No default value defined.

---

### Campaign | partitions | partition[n] | audienceLevels | audienceLevel

The `partition[n] > audienceLevels` category contains sub-categories and properties that are created and populated when a user creates audience levels in Campaign. You should not edit properties in this category.

Properties in the `partition[n] > audienceLevels > audienceLevel` category specify the number of fields in the audience level and the name of an audience level. These properties are populated when a user creates audience levels in Campaign. You should not edit properties in this category.

#### numFields

**Description**

This property is populated when a user creates audience levels on the Administration page in Campaign. You should not edit this property.

**Default value**

No default value defined.
**audienceName**

**Description**

This property is populated when a user creates audience levels on the Administration page in Campaign. You should not edit this property.

**Default value**

No default value defined.

**Campaign | partitions | partition[n] | audienceLevels | audienceLevel | field[n]**

Properties in this category define an audience level field. These properties are populated when a user creates audience levels on the Administration page in Campaign. You should not edit properties in this category.

**type**

**Description**

The partition[n] > audienceLevels > audienceLevel > field[n] > type property is populated when a user creates audience levels on the Administration page in Campaign. You should not edit this property.

**Default value**

No default value defined.

**name**

**Description**

The partition[n] > audienceLevels > audienceLevel > field[n] > name property is populated when a user creates audience levels on the Administration page in Campaign. You should not edit this property.

**Default value**

No default value defined.

**Campaign | Partitions | partition[n] | dataSources**

Properties in this category configure how Campaign interacts with databases, including its own system tables. These properties specify the databases that Campaign can access and many aspects of how queries are formed.

Each data source that you add in Campaign is represented by a category under partition[n] > dataSources > [DATA_SOURCE_NAME].

**Note:** The Campaign system tables data source for each partition must be named UA_SYSTEM_TABLES in the Marketing Platform, and a dataSources > UA_SYSTEM_TABLES category must exist in the Configuration page for every Campaign partition.

**AccessLibrary**

**Description**

Campaign chooses its data source access library according to the data source type. For example, libora4d.so is used for Oracle connectivity,
while libdb24d.so is used for DB2 connectivity. In most cases, the default selections are appropriate. However, the AccessLibrary property can be changed if the default value proves to be incorrect in your Campaign environment. For example, 64-bit Campaign provides two ODBC access libraries: one appropriate for ODBC data sources compatible with the unixODBC implementation (libodb4d.so, used by Campaign to access, for example, Informix®), and the other compatible with the DataDirect implementation (libodb4dDD.so, used by Campaign to access, for example, Teradata).

**Additional libraries for AIX**

**Description**
Campaign includes two additional libraries for AIX ODBC driver managers that support the ODBC ANSI API rather than the ODBC Unicode API:

- libodb4dAO.so (32- and 64-bit) — ANSI-only library for unixODBC-compatible implementations
- libodb4dDDAO.so (64-bit only) — ANSI-only library for DataDirect-compatible implementations

If you determine that the default access library should be overridden (for example, if you purchase a DataDirect driver manager and driver for Informix), set this parameter as required (in the example, to libodb4dDD.so, overriding the default selection of libdb24d.so).

**Default value**
No default value defined.

**ASMSaveDBAuthentication**

**Description**
The ASMSaveDBAuthentication property specifies whether, when you log in to Campaign and map a table in a data source you have not previously logged in to, Campaign saves your user name and password in IBM Unica Marketing.

If you set this property to TRUE, Campaign does not prompt you for a user name and password when you log in to the data source. If you set this property to FALSE, Campaign prompts you for a user name and password each time you log in to the data source.

**Default value**
TRUE

**Valid Values**
TRUE | FALSE

**ASMUserForDBCredentials**

**Description**
The ASMUserForDBCredentials property specifies the IBM Unica Marketing user name assigned to the Campaign system user (required for accessing the Campaign system tables).

This property is undefined by default.

**Default value**
No default value defined.

**AllowBaseJoinsInSelect**

**Description**
Determined whether Campaign attempts to perform a SQL join of base tables (from the same data source) used in a Select process; otherwise, the equivalent join is performed on the Campaign server.

**Default value**
TRUE

**Valid Values**
TRUE | FALSE

**AliasPrefix**

**Description**
The AliasPrefix property specifies the way Campaign forms the alias name that Campaign creates automatically when using a dimension table and writing to a new table.

Note that each database has a maximum identifier length; check the documentation for the database you are using to be sure that the value you set does not exceed the maximum identifier length for your database.

**Default value**
A

**AllowSegmentUsingSQLCase**

**Description**
The AllowSegmentUsingSQLCase property specifies whether the Campaign Segment process consolidates multiple SQL statements into a single SQL statement, when specific configuration conditions are met. Setting this property to TRUE results in significant performance improvements when all of the following conditions are met:
- Segments are mutually exclusive.
- All segments come from a single table.
- Criteria for each segment are based on the IBM macro language.

In this case, Campaign generates a single SQL CASE statement to perform segmentation, followed by segment-by-field processing on the Campaign application server.

**Default value**
TRUE

**Valid Values**
TRUE | FALSE

**AllowTempTables**

**Description**
The **AllowTempTables** property specifies whether Campaign creates temporary tables in the database. Creating temporary tables can significantly improve the performance of campaigns. When the value is TRUE, temporary tables are enabled.

When temporary tables are enabled, each time a query is issued against the database (for example, by the Segment process), the resulting IDs are written in a temporary table in the database. When an additional query is issued, Campaign may use that temporary table to retrieve rows from the database.

If temporary tables are not enabled, Campaign retains the selected IDs in the server memory. The additional query retrieves IDs from the database and matches them to the IDs in server memory.

For more information about controlling temporary table joins, see **MaxTempTableJoinPctSelectAll** and **MaxTempTableJoinPctWithCondition**.

You must have appropriate privileges to write in the database to use temporary tables. This is determined by the database login you provide when you connect to the database.

**Default value**

TRUE

**UseTempTablePool**

**Description**

*Note:* This property is supported only for Teradata data sources. For all other supported databases, set this option to FALSE.

When the **UseTempTablePool** property is set to TRUE, temp tables are not dropped from the database. Temp tables are truncated and reused from the pool of tables maintained by Campaign. When set to FALSE, temp tables are dropped and re-created every time a flowchart is run.

**Default value**

FALSE

**Valid Values**

TRUE | FALSE

**TempTablePreTruncateRunScript**

**Description**

*Note:* This property is supported only for Teradata data sources. For all other supported databases, this property should not be set.

Use the **TempTablePreTruncateRunScript** property to specify a script or executable to run before a temp table is truncated. The script that you specify can be used to negate the effect of a SQL statement specified in the **PostTempTableCreateRunScript** property.

For example, with the **PostTempTableCreateRunScript** property, you could specify a script that includes the following SQL statement to create an index:

```sql
CREATE INDEX <TABLENAME>Idx_1 (<KEYCOLUMNS>) ON <TABLENAME>
```
Then, specify another script with the following statement in the
TempTablePreTruncateRunScript property to drop the index:

```sql
DROP INDEX <TABLENAME>Idx_1 ON <TABLENAME>
```

**Default value**

Not defined

**Valid Values**

File name of a shell script or executable

**TempTablePreTruncateExecutionSQL**

**Description**

**Note:** This property is supported only for Teradata data sources. For all other supported databases, this property should not be set.

Use the TempTablePreTruncateExecutionSQL property to specify a SQL query to run before a temp table is truncated. The query that you specify can be used to negate the effect of a SQL statement specified in the TempTablePostExecutionSQL property.

For example, with the TempTablePostExecutionSQL property, you could specify the following SQL statement to create an index:

```sql
CREATE INDEX <TABLENAME>Idx_1 (<KEYCOLUMNS>) ON <TABLENAME>
```

Then, specify the following query in the TempTablePreTruncateExecutionSQL property to drop the index:

```sql
DROP INDEX <TABLENAME>Idx_1 ON <TABLENAME>
```

**Default value**

Not defined

**Valid Values**

A valid SQL query

**BulkInsertBlockSize**

**Description**

The BulkInsertBlockSize property defines the maximum size of a data block, in number of records, that Campaign passes to the database at a time.

**Default value**

100

**BulkInsertRequiresColumnType**

**Description**

The BulkInsertRequiresColumnType property is required to support Data Direct ODBC data sources only. Set this property to TRUE for Data Direct ODBC data sources when using bulk (array) inserts. Set the property to FALSE to be compatible with most other ODBC drivers.

**Default value**

FALSE
BulkReaderBlockSize

Description
The BulkReaderBlockSize property defines the size of a data block, in number of records, that Campaign reads from the database at a time.

Default value
2500

ConditionalSQLCloseBracket

Description
The ConditionalSQLCloseBracket property specifies the type of bracket used to indicate the end of a conditional segment in raw SQL custom macros. Conditionalized segments enclosed within the brackets specified by the ConditionalSQLOpenBracket and ConditionalSQLCloseBracket properties are used only if temp tables exist, and are ignored if there are no temp tables.

Default value
}

(closing curly brace)

ConditionalSQLOpenBracket

Description
The ConditionalSQLOpenBracket property specifies the type of bracket used to indicate the start of a conditional segment in raw SQL custom macros. Conditionalized segments enclosed within the brackets specified by the ConditionalSQLOpenBracket and ConditionalSQLCloseBracket properties are used only if temp tables exist, and are ignored if there are no temp tables.

Default value
{
( opening curly brace)

ConnectionCacheSize

Description
The ConnectionCacheSize property specifies the number of connections that Campaign maintains in a cache for each data source.

By default (N=0), Campaign establishes a new connection to a data source for each operation; if Campaign maintains a cache of connections and a connection is available for reuse, Campaign uses the cached connection rather than establishing a new connection.

If the setting is not 0, when a process is done with a connection, Campaign keeps up to the specified number of connections open for an amount of time specified by the InactiveConnectionTimeout property. After this time expires, the connections are removed from the cache and closed.

Default value
0 (zero)

DSN

Description
Set this property to the data source name (DSN) as assigned in your ODBC configuration for this Campaign data source. This value is undefined by default.

Using the Campaign data source configuration properties, you can specify multiple logical data sources that refer to the same physical data source. For example, you can create two sets of data source properties for the same data source, one with `AllowTempTables = TRUE` and the other with `AllowTempTables = FALSE`. Each of these data sources would have a different name in Campaign, but if they refer to the same physical data source and they will have the same DSN value.

**Default value**

No default value defined.

**DSNUsingOSAuthentication**

**Description**

The `DSNUsingOSAuthentication` property applies only when an Campaign data source is SQL Server. Set the value to `TRUE` when the DSN is configured to use Windows Authentication mode.

**Default value**

`FALSE`

**Valid Values**

`TRUE` | `FALSE`

**DateFormat**

**Description**

Campaign uses the value of the `DateFormat` property to determine how to parse data in date formats when using the Campaign macro language or when interpreting data from date columns.

Set the value of the `DateFormat` property to the format in which Campaign expects to receive dates from this data source. The value must match the format your database uses to display dates on select. For most databases, this setting is the same as the setting for the `DateOutputFormatString` property.

**Note:** If you use the multi-locale feature, you should not use date formats containing 3-letter months (MMM), `%b (abbreviated month name), or %B (full month name). Instead, you should use a delimited or fixed format with a numeric value for the month.

To determine the date format your database uses, select a date from the database as described below.

**Selecting a date by database**

<table>
<thead>
<tr>
<th>Database</th>
<th>To determine the correct setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2</td>
<td>Connect to the database from a machine running the Campaign server. Use <code>db2test</code>, located in the <code>Campaign\bin</code> directory, to connect and issue the following command: <code>values current date</code></td>
</tr>
</tbody>
</table>
### Table 45. Date formats (continued)

<table>
<thead>
<tr>
<th>Database</th>
<th>To determine the correct setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Informix</td>
<td>Informix has different formats for writing and selecting from the database. Connect to the database from a machine running the Campaign server. Use odbctest, located in the Campaign\bin directory, to connect and issue the following command: select today from informix.systables where tabid=1;</td>
</tr>
<tr>
<td>Netezza®</td>
<td>Connect to the database from a machine running the Campaign server. Use odbctest, located in the Campaign\bin directory, to connect and issue the following command: CREATE TABLE date_test (f1 DATE); INSERT INTO date_test values (current_date); SELECT f1 FROM date_test; Another way to select date format is to run following command: SELECT current_date FROM ANY_TABLE limit 1; where ANY_TABLE is the name of any existing table</td>
</tr>
<tr>
<td>Oracle</td>
<td>Log in to the database from the machine running the Campaign server. Use SQL *Plus to connect and issue the following command: SELECT sysdate FROM dual The current date is returned in NLS_DATE_FORMAT for that client.</td>
</tr>
<tr>
<td>SQL Server</td>
<td>Connect to the database from a machine running the Campaign listener. Use odbctest, located in the Campaign\bin directory, to connect and issue the following command: SELECT getdate()</td>
</tr>
<tr>
<td>Sybase</td>
<td>Connect to the database from a machine running the Campaign server. Use odbctest, located in the Campaign\bin directory, to connect and issue the following command: select today(*) from sys.dummy;</td>
</tr>
</tbody>
</table>

### Additional considerations

Note the following database-specific instructions.

**Teradata**

Teradata allows you to define the date format on a per-column basis. In addition to dateFormat and dateOutputFormatString, you must set SuffixOnCreateDateField. To be consistent with our system table settings, use:

- SuffixOnCreateDateField = FORMAT 'YYYY-MM-DD'
- DateFormat = DELIM_Y_M_D
- DateOutputFormatString = %Y-%m-%d

**SQL Server**

If the Use regional settings when outputting currency, numbers, dates, and times option is not checked in the ODBC data source configuration, then you cannot reset the date format. In general, it is easier to leave this setting unchecked so that the date format configuration does not change for each language.
Default value

DELIM_Y_M_D

Valid Values

Any of the formats specified in the DATE macro

**DateOutputFormatString**

**Description**

The DateOutputFormatString property specifies the format of the date datatype to be used when Campaign writes any date, such as a campaign start or end date, to a database. Set the value of the DateOutputFormatString property to the format that the data source expects for columns of the type date. For most databases, this setting is the same as the setting for the [data_source_name] > DateFormat property.

The DateOutputFormatString property can be set to any of the formats specified for format_strin the DATE_FORMAT macro. The DATE_FORMAT macro accepts two different kinds of formats. One is an identifier (for example, DELIM_M_D_Y, DDDMMYYYY, the same as accepted by the DATE macro), while the other is a format string. The value of the DateOutputFormatString property must be a format string - it must not be one of the DATE macro identifiers. Typically, use one of the delimited formats.

You can verify whether you selected the correct format by creating a table and inserting a date in the format you selected, as described in the following procedure.

**To verify DateOutputFormatString**

1. Connect to the database using the appropriate tool, as described in the table for "Selecting a date by database".
   
   Do not use the query tools that come with the database (such as SQL Server's Query Analyzer) to verify that dates are being sent to the database correctly. These query tools might convert the date format to something other than what Campaign actually sent to the database.

2. Create a table and insert a date in the format you selected. For example, if you selected %m/%d/%Y:
   
   ```sql
   CREATE TABLE date_test (F1 DATE)
   INSERT INTO date_test VALUES ('03/31/2004')
   ```
   
   If the database allows the INSERT command to complete successfully, then you have selected the correct format.

Default value

%Y/%m/%d

**DateTimeFormat**

**Description**

The value of the [data_source_name] > DateTimeFormat property specifies the format in which Campaign expects to receive datetime/timestamp data from a database. It must match the format your database uses to display datetime/timestamp data on select. For most databases, this setting is the same as the setting for DateOutputFormatString.
Typically, you should set the DateTimeFormat by prepending your DateFormat value with DT_ after determining the DateFormat value as described in the table for "Selecting a date by database".

**Note:** If you use the multi-locale feature, you should not use date formats containing 3-letter months (MMM), %b (abbreviated month name), or %B (full month name). Instead, you should use a delimited or fixed format with a numeric value for the month.

**Default value**

`DT_DELIM_Y_M_D`

**Valid Values**

Only delimited formats are supported, as follows:

- `DT_DELIM_M_D`
- `DT_DELIM_M_D_Y`
- `DT_DELIM_Y_M`
- `DT_DELIM_Y_M_D`
- `DT_DELIM_M_Y`
- `DT_DELIM_D_M`
- `DT_DELIM_D_M_Y`

**DateTimeOutputFormatString**

**Description**

The DateTimeOutputFormatString property specifies the format of the datetime datatype to be used when Campaign writes any datetime, such as a campaign start or end date and time, to a database. Set the value of the DateTimeOutputFormatString property to the format that the data source expects for columns of the type datetime. For most databases, this setting is the same as the setting for the `[data_source_name] > DateTimeFormat` property.

See DateOutputFormatString for a method for verifying that the format you select is correct.

**Default value**

`%Y/%m/%d %H:%M:%S`

**DB2NotLoggedInitially**

**Description**

The DB2NotLoggedInitially property determines whether Campaign uses the not logged initially SQL syntax when populating temporary tables in DB2. When set to TRUE, this property disables logging for inserts into temp tables, which improves performance and decreases database resource consumption.

If your version of DB2 does not support the not logged initially syntax, set this property to FALSE.

**Default value**

`TRUE`

**Valid Values**
DB2NotLoggedInitiallyUserTables

Description
The DB2NotLoggedInitiallyUserTables property determines whether Campaign uses the not logged initially SQL syntax for inserts into DB2 user tables. When set to TRUE, this property disables logging for inserts into the user tables, which improves performance and decreases database resource consumption.

Note: When set to TRUE, if a user table transaction fails for any reason, the table will become corrupted and must be dropped. All data previously contained in the table will be lost.

Note: The DB2NotLoggedInitiallyUserTables property is not used for the Campaign system tables.

Default value
FALSE

Valid Values
TRUE | FALSE

DefaultScale

Description
The DefaultScale property determines floating point precision when a Campaign Snapshot or Campaign Export process exports numeric fields to a database table.

If the incoming database table defines the precision and scale of the number field, DefaultScale=0 preserves the information. For example, 3.9876 is output as 3.9876. You can limit the floating point precision by changing this property. For example, if you set the value to 3, floating point precision would be three places (0.NNN).

Note: A flat file does not provide precision and scale information. If the incoming number field comes from a text file, or from a database field that does not provide precision and scale in its definition, Campaign does not know what precision and scale to use. In this case, Campaign uses the DefaultScale value to determine floating point precision. For example, DefaultScale=0 means “output 0 digits to the right of the decimal point”, so 3.9876 would be output as 3.

The maximum value for DefaultScale is 15, including both the integer and floating point portions of a number. For example, DefaultScale=15 results in 15 digits to the right of the decimal point, but no digits to the left of the decimal point.

Default value
0 (zero)

DeleteAsRecreate

Description
The `DeleteAsRecreate` property specifies whether, when an output process is configured to `REPLACE TABLE` and if `TRUNCATE` is not supported, Campaign drops and recreates the table or only deletes from the table.

When the value is `TRUE`, Campaign drops the table and recreates it.

When the value is `FALSE`, Campaign executes a `DELETE FROM` from the table.

**Default value**

`FALSE`

**Valid Values**

`TRUE | FALSE`

#### DeleteAsTruncate

**Description**

The `DeleteAsTruncate` property specifies whether, when an output process is configured to `REPLACE TABLE`, Campaign uses `TRUNCATE TABLE` or deletes from the table.

When the value is `TRUE`, Campaign runs a `TRUNCATE TABLE` from the table.

When the value is `FALSE`, Campaign runs a `DELETE FROM` from the table.

The default value depends on the database type.

**Default value**

- `TRUE` for Netezza, Oracle, Sybase and SQLServer.
- `FALSE` for other database types.

**Valid Values**

`TRUE | FALSE`

#### DisallowTempTableDirectCreate

**Description**

The `DisallowTempTableDirectCreate` property specifies the way Campaign adds data to a temp table.

When set to `FALSE`, Campaign performs direct create-and-populate SQL syntax using one command; for example, `CREATE TABLE <table_name> AS ...` (for Oracle and Netezza) and `SELECT <field_names> INTO <table_name> ...` (for SQL Server).

When set to `TRUE`, Campaign creates the temp table and then populates it directly from table to table using separate commands.

**Default value**

`FALSE`

**Valid Values**

`TRUE | FALSE`

#### EnableBaseDimSelfJoin

**Description**

The `EnableBaseDimSelfJoin` property specifies whether the Campaign database behavior will perform self-joins when the `Base` and `Dimension`
tables are mapped to the same physical table and the Dimension is not related to the Base table on the Base table’s ID field(s).

By default, this property is set to FALSE, and when the Base and Dimension tables are the same database table and the relationship fields are the same (for example, AcctID to AcctID), Campaign assumes that you do not want to perform a join.

Default value
FALSE

EnableSelectDistinct
Description
The EnableSelectDistinct property specifies whether the internal lists of IDs for Campaign are de-duplicated by the Campaign server or by the database.

When the value is TRUE, the database performs de-duplication, and SQL queries generated against the database then have the form (when appropriate):
SELECT DISTINCT key FROM table

When the value is FALSE, the Campaign server performs de-duplication, and SQL queries generated against the database have the form:
SELECT key FROM table

Leave the default value of FALSE if:
• Your database is constructed so that unique identifiers (primary keys of base tables) are already guaranteed to be de-duped.
• You want the Campaign application server to perform de-duplication to reduce resource consumption/burden on the database.

Regardless of what value you specify for this property, Campaign automatically ensures that keys are de-duplicated as required. This property merely controls where the de-duplication effort occurs (on the database or on the Campaign server).

Default value
TRUE

Valid Values
TRUE | FALSE

EnableSelectOrderBy
Description
The EnableSelectOrderBy property specifies whether the internal lists of IDs for Campaign are sorted by the Campaign server or by the database.

When the value is TRUE, the database performs the sorting, and SQL queries generated against the database have the form:
SELECT <key> FROM <table> ORDER BY <key>

When the value is FALSE, the Campaign server performs the sorting, and SQL queries generated against the database have the form:
SELECT <key> FROM <table>
**Note:** Only set this property to FALSE if the audience levels used are text strings on a non-English database. All other scenarios can use the default of TRUE.

**Default value**
TRUE

**Valid Values**

True | False

**ExcludeFromTableDisplay**

**Description**

The ExcludeFromTableDisplay parameter allows you to limit the database tables that are displayed during table mapping in Campaign. It does not reduce the number of table names retrieved from the database.

Table names matching the specified patterns are not displayed.

For example, if you set the value of this parameter to `sys.*`, tables with names that begin with `sys.` are not displayed. Note that the values for this parameter are case-sensitive.

**Default value**

UAC_*, which excludes temp tables and Extract tables, when the ExtractTablePrefix property’s value is the default value

**ExtractTablePrefix**

**Description**

The ExtractTablePrefix property specifies a string that is automatically prepended to all Extract table names in Campaign.

**Default value**

UAC_EX

**ForceNumeric**

**Description**

The ForceNumeric property specifies whether Campaign retrieves numeric values as the data type double. When the value is set to TRUE, Campaign retrieves all numeric values as the data type double.

**Default value**

FALSE

**Valid Values**

TRUE | FALSE

**InactiveConnectionTimeout**

**Description**

The InactiveConnectionTimeout property specifies the number of seconds an inactive Campaign database connection is left open before it is closed. Setting the value to 0 disables the timeout, leaving the connection open.

**Default value**

0
120

InsertLogSize

Description
The InsertLogSize property specifies when a new entry is entered in the log file while the Campaign Snapshot process is running. Every time the number of records written by the Snapshot process reaches a multiple of the number specified in the InsertLogSize property, a log entry is written. The log entries can help you determine how far a running Snapshot process has progressed. Setting this value too low may create large log files.

Default value
100000 (one hundred thousand records)

Valid Values
Positive integers

JndiName

Description
The JndiName property is used only when configuring the Campaign system tables (not for other data sources, such as customer tables). Set its value to the Java Naming and Directory Interface (JNDI) data source that is defined in the application server (WebSphere or WebLogic).

Default value
campaignPartition1DS

LoaderCommand

Description
The LoaderCommand property specifies the command issued to invoke your database load utility in Campaign. If you set this parameter, Campaign enters the database loader utility mode for all output files from the Snapshot process that are used with the “replace all records” settings. This parameter also invokes the database loader utility mode when Campaign uploads ID lists into temp tables.

The valid value for this property is any full path name either to the database load utility executable or to a script that launches the database load utility. Using a script allows you to perform additional setup before invoking the load utility (for example, moving files to a database server first or invoking ISQL to use the load command in Sybase IQ).

Most database load utilities require several arguments to be launched successfully. These arguments can include specifying the data file and control file to load from and the database and table to load into. Campaign supports the following tokens, which are replaced by the specified elements when the command is run. Consult your database load utility documentation for the correct syntax to use when invoking your database load utility.

This parameter is undefined by default.

Tokens available to LoaderCommand are described below.
### Table 46. Tokens available to LoaderCommand

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart being run.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNCODE&gt;</code></td>
<td>This token is replaced with the code for the campaign associated with the flowchart.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart being run.</td>
</tr>
<tr>
<td><code>&lt;CONTROLFILE&gt;</code></td>
<td>This token is replaced with the full path and file name to the temporary control file that Campaign generates according to the template that is specified in the LoaderControlFileTemplate parameter.</td>
</tr>
<tr>
<td><code>&lt;DATABASE&gt;</code></td>
<td>This token is replaced with the name of the data source that Campaign is loading data into. This is the same data source name used in the category name for this data source.</td>
</tr>
<tr>
<td><code>&lt;DATAFILE&gt;</code></td>
<td>This token is replaced with the full path and file name to the temporary data file created by Campaign during the loading process. This file is in the Campaign Temp directory, UNICA_ACTMPDIR.</td>
</tr>
<tr>
<td><code>&lt;DBUSER&gt;</code></td>
<td>This token is replaced with the database user name for the database.</td>
</tr>
<tr>
<td><code>&lt;DSN&gt;</code></td>
<td>This token is replaced with the value of the DSN property. If the DSN property is not set, the <code>&lt;DSN&gt;</code> token is replaced by the data source name used in the category name for this data source (the same value used to replace the <code>&lt;DATABASE&gt;</code> token).</td>
</tr>
<tr>
<td><code>&lt;FLOWCHARTNAME&gt;</code></td>
<td>This token is replaced with the name of the flowchart being run.</td>
</tr>
<tr>
<td><code>&lt;NUMFIELDS&gt;</code></td>
<td>This token is replaced with the number of fields in the table.</td>
</tr>
<tr>
<td><code>&lt;PASSWORD&gt;</code></td>
<td>This token is replaced with the database password from the current flowchart connection to the data source.</td>
</tr>
<tr>
<td><code>&lt;TABLE&gt;</code></td>
<td>This token is obsolete, but is supported for compatibility with earlier versions. See <code>&lt;TABLENAME&gt;</code>, which replaced <code>&lt;TABLE&gt;</code> as of version 4.6.3.</td>
</tr>
<tr>
<td><code>&lt;TABLENAME&gt;</code></td>
<td>This token is replaced with the database table name that Campaign is loading data into. This is the target table from your Snapshot process or the name of the Temp Table being created by Campaign.</td>
</tr>
<tr>
<td><code>&lt;USER&gt;</code></td>
<td>This token is replaced with the database user from the current flowchart connection to the data source.</td>
</tr>
</tbody>
</table>

**Default value**

No default value defined.

**Valid Values**

Any full path name either to the database load utility executable or to a script that launches the database load utility

**LoaderCommandForAppend**

**Description**
The `LoaderCommandForAppend` parameter specifies the command issued to invoke your database load utility for appending records to a database table in Campaign. If you set this parameter, Campaign enters database loader utility mode for all output files from the Snapshot process that are used with the “append records” settings.

This parameter is specified as a full path name either to the database load utility executable or to a script that launches the database load utility. Using a script allows you to perform additional setup before invoking the load utility (for example, moving files to a database server first or invoking ISQL to use the load command in Sybase IQ).

Most database load utilities require several arguments to be successfully launched. These can include specifying the data file and control file to load from and the database and table to load into. The tokens are replaced by the specified elements when the command is run.

Consult your database load utility documentation for the correct syntax to use when invoking your database load utility.

This parameter is undefined by default.

Tokens available to `LoaderCommandForAppend` are described below.

**Table 47. Tokens available to LoaderCommandForAppend**

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart being run.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNCODE&gt;</code></td>
<td>This token is replaced with the code for the campaign associated with the flowchart being run.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart being run.</td>
</tr>
<tr>
<td><code>&lt;CONTROLFILE&gt;</code></td>
<td>This token is replaced with the full path and file name to the temporary control file that Campaign generates according to the template that is specified in the <code>LoaderControlFileTemplate</code> parameter.</td>
</tr>
<tr>
<td><code>&lt;DATABASE&gt;</code></td>
<td>This token is replaced with the name of the data source that Campaign is loading data into. This is the same data source name used in the category name for this data source.</td>
</tr>
<tr>
<td><code>&lt;DATAFILE&gt;</code></td>
<td>This token is replaced with the full path and file name to the temporary data file created by Campaign during the loading process. This file is in the Campaign Temp directory, <code>UNICA_ACTMPDIR</code>.</td>
</tr>
<tr>
<td><code>&lt;DBUSER&gt;</code></td>
<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td><code>&lt;DSN&gt;</code></td>
<td>This token is replaced with the value of the DSN property. If the DSN property is not set, the <code>&lt;DSN&gt;</code> token is replaced by the data source name used in the category name for this data source (the same value used to replace the <code>&lt;DATABASE&gt;</code> token).</td>
</tr>
<tr>
<td><code>&lt;FLOWCHARTNAME&gt;</code></td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td><code>&lt;NUMFIELDS&gt;</code></td>
<td>This token is replaced with the number of fields in the table.</td>
</tr>
</tbody>
</table>
Table 47. Tokens available to LoaderCommandForAppend (continued)

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>

<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the database user from the current flowchart connection to the data source.</td>
</tr>
</tbody>
</table>

Default value

No default value defined.

LoaderControlFileTemplate

Description

The LoaderControlFileTemplate property specifies the full path and file name to the control file template configured in Campaign. When this parameter is set, Campaign dynamically builds a temporary control file based on the template that you specify here. The path and name of this temporary control file is available to the <CONTROLFILE> token that is available to the LoaderCommand parameter.

Before you use Campaign in the database loader utility mode, you must configure the control file template that is specified by this parameter. The control file template supports the following tokens, which are dynamically replaced when the temporary control file is created by Campaign.

For the correct syntax required for your control file, see your database loader utility documentation.

This parameter is undefined by default.

Tokens available to LoaderControlFileTemplate are the same as those described for the LoaderCommand property, plus the following special tokens, which are repeated once for each field in the outbound table.

Table 48. Tokens available to LoaderControlFileTemplate

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DBCOLUMNNUMBER&gt;</td>
<td>This token is replaced with the column ordinal in the database.</td>
</tr>
<tr>
<td>&lt;FIELDLENGTH&gt;</td>
<td>This token is replaced with the length of the field being loaded into the database.</td>
</tr>
<tr>
<td>&lt;FIELDNAME&gt;</td>
<td>This token is replaced with the name of the field being loaded into the database.</td>
</tr>
<tr>
<td>&lt;FIELDNUMBER&gt;</td>
<td>This token is replaced with the number of the field being loaded into the database.</td>
</tr>
</tbody>
</table>
### Table 48. Tokens available to LoaderControlFileTemplate (continued)

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;FIELDTYPE&gt;</td>
<td>This token is replaced with the literal &quot;CHAR( )&quot;. The length of this field is specified between the (). If your database happens to not understand the field type, CHAR, you can manually specify the appropriate text for the field type and use the &lt;FIELDLENGTH&gt; token. For example, for SQLSVR and SQL2000 you would use &quot;SQLCHAR(&lt;FIELDLENGTH&gt;)&quot;</td>
</tr>
<tr>
<td>&lt;NATIVETYPE&gt;</td>
<td>This token is replaced with the actual database type that this field is loaded into.</td>
</tr>
<tr>
<td>&lt;xyz&gt;</td>
<td>This token places the specified character(s) on all fields being loaded into the database, except the last. A typical use is &lt;,&gt; which repeats a comma for all fields except the last.</td>
</tr>
<tr>
<td>&lt;&quot;xyz&gt;</td>
<td>This token places the specified characters only on the last repeated line.</td>
</tr>
<tr>
<td>&lt;lxyz&gt;</td>
<td>This token places the specified character(s), including the angle brackets &lt; &gt;, on all lines.</td>
</tr>
</tbody>
</table>

**Default value**

No default value defined.

### LoaderControlFileTemplateForAppend

**Description**

The LoaderControlFileTemplateForAppend property specifies the full path and file name to the control file template configured in Campaign. When this parameter is set, Campaign dynamically builds a temporary control file based on the template that is specified here. The path and name of this temporary control file is available to the <CONTROLFILE> token that is available to the LoaderCommandForAppend property.

Before you use Campaign in the database loader utility mode, you must configure the control file template that is specified by this parameter. The control file template supports the following tokens, which are dynamically replaced when the temporary control file is created by Campaign.

See your database loader utility documentation for the correct syntax required for your control file. Tokens available to your control file template are the same as those for the LoaderControlFileTemplate property.

This parameter is undefined by default.

**Default value**

No default value defined.

### LoaderDelimiter

**Description**

The LoaderDelimiter property specifies whether the temporary data file is a fixed-width or delimited flat file, and, if it is delimited, the characters Campaign uses as delimiters.

If the value is undefined, Campaign creates the temporary data file as a fixed width flat file.
If you specify a value, it is used when the loader is invoked to populate a table that is known to be empty. Campaign creates the temporary data file as a delimited flat file, using the value of this property as the delimiter.

This property is undefined by default.

Default value

No default value defined.

Valid Values

Characters, which can be enclosed in double quotation marks, if wanted.

**LoaderDelimiterAtEnd**

Description

Some external load utilities require that the data file be delimited and that each line end with the delimiter (for example, Informix's dbaccess using External Tables). To accommodate this requirement, set the `LoaderDelimiterAtEnd` value to `TRUE`, so that when the loader is invoked to populate a table that is known to be empty, Campaign uses delimiters at the end of each line.

FALSE

Default value

FALSE

Valid Values

TRUE | FALSE

**LoaderDelimiterAtEndForAppend**

Description

Some external load utilities require that the data file be delimited and that each line end with the delimiter (for example, Informix's dbaccess using External Tables). To accommodate this requirement, set the `LoaderDelimiterAtEndForAppend` value to `TRUE`, so that when the loader is invoked to populate a table that is not known to be empty, Campaign uses delimiters at the end of each line.

Default value

FALSE

Valid Values

TRUE | FALSE

**LoaderDelimiterForAppend**

Description

The `LoaderDelimiterForAppend` property specifies whether the temporary Campaign data file is a fixed-width or delimited flat file, and, if it is delimited, the character or set of characters used as delimiters.

If the value is undefined, Campaign creates the temporary data file as a fixed width flat file.
If you specify a value, it is used when the loader is invoked to populate a table that is not known to be empty. Campaign creates the temporary data file as a delimited flat file, using the value of this property as the delimiter.

This property is undefined by default.

**Default value**

No default value defined.

**Valid Values**

Characters, which you may enclose in double quotation marks, if wanted.

### LoaderUseLocaleDP

**Description**

The `LoaderUseLocaleDP` property specifies, when Campaign writes numeric values to files to be loaded by a database load utility, whether the locale-specific symbol is used for the decimal point.

Set this value to `FALSE` to specify that the period (.) is used as the decimal point.

Set this value to `TRUE` to specify that the decimal point symbol appropriate to the locale is used.

**Default value**

`FALSE`

**Valid Values**

`TRUE` | `FALSE`

### MaxItemsInList

**Description**

Allows you to specify the maximum number of items that Campaign is allowed to include in a single list in SQL (for example, the list of values following an `IN` operator in a `WHERE` clause).

**Default value**

`1000` (Oracle only), `0` (unlimited) for all other databases

**Valid Values**

integers

### MaxQueryThreads

**Description**

The `MaxQueryThreads` property specifies the upper limit on the number of simultaneous queries allowed to run against each database source from a single Campaign flowchart.

Campaign runs database queries using independent threads. Because Campaign processes run in parallel, it is common to have multiple queries running simultaneously against a single data source. If the number of queries to be run in parallel exceeds the value specified by this property, the Campaign server automatically limits the number of simultaneous queries to this value.
The maximum value is unlimited. Note that when the maxReuseThreads property is set to a non-zero value, it should be greater than or equal to the value of MaxQueryThreads.

Default value

Varies depending on the database

MaxRowFetchRecords

Description

When the selected number of IDs is less than the value specified by the MaxRowFetchRecords property, Campaign passes the IDs to the database, one at a time in a separate SQL query. This process may be very time-consuming. If the number of selected IDs is greater than the value specified by this parameter, Campaign uses temporary tables (if allowed against the database source), or it pulls down all the values from the table, not including any unnecessary values.

For performance reasons, it is best to keep this number low.

Default value

100

MaxTempTableJoinPctSelectAll

Description

When a query is issued, Campaign creates a temporary table on the database containing the exact list of IDs, as a result of the query. When an additional query that selects all records is issued against the database, the MaxTempTableJoinPctSelectAll property specifies whether a join is performed with the temporary table.

If the relative size of the temporary table (specified as a percentage) is greater than the value of the MaxTempTableJoinPctWithCondition property, no join is performed. All records are selected first, then unwanted records are discarded.

If the relative size of the temporary table (specified as a percentage) is less than or equal to the value of MaxTempTableJoinPctWithCondition property, the join is performed with the temporary table first, and then the resulting IDs are retrieved to the server.

This property is applicable only if the value of the AllowTempTables property is set to TRUE. This property is ignored if the useInDbOptimization property is set to YES.

Default value

90

Valid Values

Integers between 0-100. A value of 0 means that temporary table joins are never used; a value of 100 means that table joins are always used, regardless of the size of the temporary table.

Example

Assume that MaxTempTableJoinPctSelectAll is set to 90. First, you might want to select customers (CustID) with account balances (Accnt_balance) greater than $1,000 from the database table (Customer).
The corresponding SQL expression generated by the Select process may look like this:

```sql
SELECT CustID FROM Customer
WHERE Acnt_balance > 1000
```

The Select process may retrieve 100,000 IDs from the total table size of 1,000,000, which is 10%. If temporary tables are allowed, Campaign writes the selected IDs (TempID) into a temporary table (Temp_table) in the database.

Then, you might want to snapshot the selected IDs (CustID) together with the actual balance (Acnt_balance). Since the relative size of the temporary table (Temp_table) is less than 90 percent (MaxTempTableJoinPctSelectAll), the join is done with the temporary table first. The SQL expression generated by the Snapshot process may look like this:

```sql
SELECT CustID, Acnt_balance FROM Customer, Temp_table WHERE CustID = TempID
```

If the Select process retrieves more than 90 percent the subsequent Snapshot process retrieves all the records, and matches them with the first set of IDs, discarding the unnecessary ones.

The SQL expression generated by the Snapshot process may look like this:

```sql
SELECT CustID, Acnt_balance FROM Customer
```

### MaxTempTableJoinPctWithCondition

**Description**

When a query is issued, Campaign creates a temporary table on the database containing the exact list of IDs, as a result of the query. When an additional query, selecting records with limitation conditions is issued against the database, the MaxTempTableJoinPctWithCondition property specifies whether a join should be performed with the temporary table.

If the relative size of the temporary table (specified as a percentage) is greater than the value of MaxTempTableJoinPctWithCondition, no join is performed. This avoids the overhead in the database where it may not be needed. In this case, the query is issued against the database, the resulting list of IDs retrieved, and then unwanted records are discarded as they are matched to the list in server memory.

If the relative size of the temporary table (in percentage) is less than or equal to the value of MaxTempTableJoinPctWithCondition, the join is done with the temporary table first, and then the resulting IDs are retrieved to the server.

This property is applicable only if the value of the AllowTempTables property is set to TRUE.

**Default value**

20

**Valid Values**

Integers between 0-100. A value of 0 means that temporary table joins are never used; a value of 100 means that table joins are always used, regardless of the size of the temporary table.

### MinReqForLoaderCommand

**Description**
Use this property to set the threshold for using the bulk loader. Campaign invokes the script assigned to the LoaderCommand parameter when the number of unique IDs in the input cell exceeds the value defined here. The value of this property does not represent the number of records that will be written.

If this property is not configured, Campaign assumes that the value is the default value (zero). If this property is configured but a negative value or non-integer value is set as the value, Campaign assumes that the value is zero.

Default value
0 (zero)

Valid Values
Integers

MinReqForLoaderCommandForAppend
Description
Use this property to set the threshold for using the bulk loader. Campaign invokes the script assigned to the LoaderCommandForAppend parameter when the number of unique IDs in the input cell exceeds the value defined here. The value of this property does not represent the number of records that will be written.

If this property is not configured, Campaign assumes that the value is the default value (zero). If this property is configured but a negative value or non-integer value is set as the value, Campaign assumes that the value is zero.

Default value
0 (zero)

Valid Values
Positive integers

NumberOfRetries
Description
The NumberOfRetries property specifies the number of times Campaign automatically retries a database operation on failure. Campaign automatically resubmits queries to the database this number of times before reporting a database error or failure.

Default value
0 (zero)

ODBCTableTypes
Description
The ODBCTableTypes property is required to support Sybase IQ/ASE data sources only. Campaign requires this property to be set in order to display the list of tables in the table mapping window. Add the following values to this property to enable mapping for Sybase IQ/ASE data sources:

'TABLE', 'VIEW', 'SYNONYM', 'ALIAS'
This property is empty by default, which is appropriate for data sources other than Sybase IQ/ASE.

**Default value**
Not defined

**Valid Values**
'TABLE','VIEW','SYNONYM','ALIAS'

**ODBCUnicode**

**Description**
The ODBCUnicode property specifies the type of encoding used in Campaign ODBC calls. It is used only with ODBC data sources and is ignored when used with Oracle or DB2 native connectivity.

**Important:** If this property is set to UTF-8 or UCS-2, the data source’s StringEncoding value must be set to either UTF-8 or WIDEUTF-8, otherwise the ODBCUnicode property’s setting is ignored.

**Default value**
disabled

**Valid Values**
Possible values for this property are:
- Disabled - Campaign uses ANSI ODBC calls.
- UTF-8 - Campaign uses Unicode ODBC calls and assumes that a SQLWCHAR is a single byte. This is compatible with DataDirect ODBC drivers.
- UCS-2 - Campaign uses Unicode ODBC calls and assumes that a SQLWCHAR is 2 bytes. This is compatible with Windows and unixODBC ODBC drivers.

**ODBCv2**

**Description**
Use the ODBCv2 property to specify which ODBC API specification Campaign should use for the data source.

The default value of FALSE allows Campaign to use the v3 API specification, while a setting of TRUE causes Campaign to use the v2 API specification. Set the ODBCv2 property to TRUE for data sources that do not support the ODBC v3 API specification.

When the ODBCv2 property is set to TRUE, Campaign does not support the ODBC Unicode API, and values other than disabled for the ODBCUnicode property are not recognized.

**Default value**
FALSE

**Valid Values**
TRUE | FALSE

**OwnerForTableDisplay**

**Description**
The **OwnerForTableDisplay** property allows you to limit the table mapping display in Campaign to tables owned by a specified user, or to one or more sets of tables owned by the specified user(s).

To display only those tables owned by one or more users, specify the database user IDs using a comma-separated list. For example:

<property name=“OwnerForTableDisplay”>user1,user2,user3</property>

To specify a table name pattern in addition to the user name, append the pattern to the user ID. For example, the following setting limits the table display to tables beginning with ABC for user1 and XYZ for user2:

OwnerForTableDisplay=user1.ABC%,user2.XYZ%

**Default value**

No default value defined.

**PostSegmentTableCreateRunScript**

**Description**

Specifies a script or executable that Campaign runs after a Segment temp table has been created and populated.

**Tokens available to PostSegmentTableCreateRunScript** are described below.

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;DBUSER&gt;</code></td>
<td>This token is replaced with the database user name for the database where the Segment temp table was created.</td>
</tr>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which the Segment temp table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which the Segment temp table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNCODE&gt;</code></td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which the Segment temp table was created.</td>
</tr>
<tr>
<td><code>&lt;FLOWCHARTNAME&gt;</code></td>
<td>This token is replaced with the name of the flowchart associated with the Segment temp table creation.</td>
</tr>
<tr>
<td><code>&lt;PASSWORD&gt;</code></td>
<td>This token is replaced with the database password from the current flowchart connection to the data source.</td>
</tr>
<tr>
<td><code>&lt;KEYCOLUMNS&gt;</code></td>
<td>This token is replaced with the Segment temp table column name(s).</td>
</tr>
</tbody>
</table>

**Default value**

Not defined

**Valid Values**

File name of a script or executable

**PostSnapshotTableCreateRunScript**

**Description**
Use the `PostSnapshotTableCreateRunScript` property to specify a script or executable that Campaign runs after a Snapshot table has been created and populated.

Tokens available to `PostSnapshotTableCreateRunScript` are described below.

**Table 50. Tokens available to PostSnapshotTableCreateRunScript**

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;DBUSER&gt;</code></td>
<td>This token is replaced with the database user name for the database where the Snapshot table was created.</td>
</tr>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which the Snapshot table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which the Snapshot table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNCODE&gt;</code></td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which the Snapshot table was created.</td>
</tr>
<tr>
<td><code>&lt;FLOWCHARTNAME&gt;</code></td>
<td>This token is replaced with the name of the flowchart associated with the Snapshot table creation.</td>
</tr>
<tr>
<td><code>&lt;PASSWORD&gt;</code></td>
<td>This token is replaced with the database password from the current flowchart connection to the data source.</td>
</tr>
<tr>
<td><code>&lt;KEYCOLUMNS&gt;</code></td>
<td>This token is replaced with the Snapshot table column name(s).</td>
</tr>
</tbody>
</table>

**Default value**
Not defined

**Valid Values**
File name of a shell script or executable

**PostExtractTableCreateRunScript**

**Description**
Use the `PostExtractTableCreateRunScript` property to specify a script or executable for Campaign to run after an Extract table has been created and populated.

Tokens available to `PostExtractTableCreateRunScript` are described below.

**Table 51. Tokens available to PostExtractTableCreateRunScript**

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;DBUSER&gt;</code></td>
<td>This token is replaced with the database user name for the database where the Extract table was created.</td>
</tr>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which the Extract table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which the Extract table was created.</td>
</tr>
</tbody>
</table>

<td><code>&lt;FLOWCHARTNAME&gt;</code></td>
<td>This token is replaced with the name of the flowchart associated with the Extract table creation.</td>
</tr>
<tr>
<td><code>&lt;PASSWORD&gt;</code></td>
<td>This token is replaced with the database password from the current flowchart connection to the data source.</td>
</tr>
<tr>
<td><code>&lt;KEYCOLUMNNS&gt;</code></td>
<td>This token is replaced with the Extract table column name(s).</td>
</tr>
</tbody>
</table>

Default value

Not defined

Valid Values

File name of a shell script or executable

**PadTextWithSpaces**

**Description**

When set to TRUE, the PadTextWithSpaces property causes Campaign to pad text values with spaces until the string is the same width as the database field.

**Default value**

FALSE

**Valid Values**

TRUE | FALSE

**PostTempTableCreateRunScript**

**Description**

Use the PostTempTableCreateRunScript property to specify a script or executable for Campaign to run after a temp table has been created and populated in a user data source or in the system tables database.

Tokens available to PostTempTableCreateRunScript are described below.

Table 52. Tokens available to PostTempTableCreateRunScript

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;DBUSER&gt;</code></td>
<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNCODE&gt;</code></td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
</tbody>
</table>
Table 52. Tokens available to PostTempTableCreateRunScript (continued)

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;FLOWCHARTNAME&gt;</code></td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td><code>&lt;PASSWORD&gt;</code></td>
<td>This token is replaced with the database password from the current flowchart connection to the data source.</td>
</tr>
<tr>
<td><code>&lt;KEYCOLUMNS&gt;</code></td>
<td>This token is replaced with the temp table column name(s).</td>
</tr>
</tbody>
</table>

Default value

No default value defined.

**PostUserTableCreateRunScript**

**Description**

Specifies a script or executable that Campaign runs after a User table has been created and populated.

Tokens available to PostUserTableCreateRunScript are described below.

Table 53. Tokens available to PostUserTableCreateRunScript

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;DBUSER&gt;</code></td>
<td>This token is replaced with the database user name for the database where the User table was created.</td>
</tr>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which the User table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which the User table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNCODE&gt;</code></td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which the User table was created.</td>
</tr>
<tr>
<td><code>&lt;FLOWCHARTNAME&gt;</code></td>
<td>This token is replaced with the name of the flowchart associated with the User table creation.</td>
</tr>
<tr>
<td><code>&lt;PASSWORD&gt;</code></td>
<td>This token is replaced with the database password from the current flowchart connection to the data source.</td>
</tr>
<tr>
<td><code>&lt;KEYCOLUMNS&gt;</code></td>
<td>This token is replaced with the User table column name(s).</td>
</tr>
</tbody>
</table>

Default value

Not defined.

**Valid Values**

File name of a script or executable

**PrefixOnSelectSQL**

**Description**

Use the PrefixOnSelectSQL property to specify a string that is automatically prepended to all SELECT SQL expressions generated by Campaign.
This property applies only to SQL generated by Campaign, and does not apply to SQL in “raw SQL” expressions used in the Select process.

This property is automatically added to the SELECT SQL expression without checking its syntax. If you use this property, make sure that it is a legal expression.

This property is undefined by default.

Tokens available to PrefixOnSelectSQL are described below.

### Table 54. Tokens available to PrefixOnSelectSQL

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AMUSER&gt;</td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNCODE&gt;</td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNNAME&gt;</td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;DBUSER&gt;</td>
<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td>&lt;FLOWCHARTNAME&gt;</td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

**Default value**

No default value defined.

### QueryThreadSleep

**Description**

The QueryThreadSleep property affects the CPU utilization of the Campaign server process (UNICA_ACSVR). When the value is TRUE, the thread that the Campaign server process uses to check for query completion sleeps between checks. When the value is FALSE, the Campaign server process checks continuously for query completion.

**Default value**

TRUE

### ReaderLogSize

**Description**

The ReaderLogSize parameter defines when Campaign makes a new entry in the log file when reading data from the database. Every time the number of records read from the database reaches a multiple of the number defined by this parameter, a log entry is written in the log file. This parameter can help you determine how far a process has progressed in its run. Setting this value too low may create large log files.

**Default value**

Appendix A. Configuration properties on the configuration page
1000000 (one million records)

Valid Values
Integers

**SegmentTempTablePrefix**

**Description**
Sets the prefix for Segment tables created by the CreateSeg process in this data source.

**Default value**
UACS

**SQLOnConnect**

**Description**
The SQLOnConnect property defines a complete SQL statement that Campaign runs immediately after each database connection.

The SQL statement generated by this property is automatically passed to your database without checking its syntax. If you use this property, make sure that it is a legal expression. The string may be enclosed in quotation marks, but this is not required.

This property is undefined by default.

Tokens available to SQLOnConnect are described below.

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AMUSER&gt;</td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNCODE&gt;</td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNNAME&gt;</td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;DBUSER&gt;</td>
<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td>&lt;FLOWCHARTNAME&gt;</td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

**Default value**
No default value defined.

**UOSQLOnConnect**

**Description**
The SQLOnConnect property defines a complete SQL statement that Campaign runs immediately after each database connection. The UOSQLOnConnect property is similar to this, but specifically applicable to Optimize.

The SQL statement generated by this property is automatically passed to your database without checking its syntax. If you use this property, make sure that it is a legal expression. The string may be enclosed in quotation marks, but this is not required.

This property is undefined by default.

Tokens available to UOSQLOnConnect are described below.

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AMUSER&gt;</td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNCODE&gt;</td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNNAME&gt;</td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;DBUSER&gt;</td>
<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td>&lt;FLOWCHARTNAME&gt;</td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

Default value

No default value defined.

**ShareConnection**

**Description**

The ShareConnection property is no longer used and should remain set to its default value, FALSE.

**Default value**

FALSE

**Valid Values**

FALSE

**StringEncoding**

**Description**

The StringEncoding property specifies the character encoding of the database. When Campaign retrieves data from the database, the data is transcoded from the encoding specified to the internal encoding of Campaign (UTF-8). Likewise, when Campaign sends a query to the
database, character data is transcoded from the internal encoding of Campaign to the encoding specified in theStringEncoding property.

The value of this property must match the encoding used on the database client.

Do not leave this value blank although it is undefined by default. If you use ASCII data, set this value to UTF-8.

**Note:** If your database client’s encoding is set for UTF-8, the preferred setting for this value is WIDEUTF-8. The WIDE-UTF-8 setting works only if your database client is set to UTF-8.

**Important:** If you use the partitions > partition[n] > dataSources > [data_source_name] > ODBCUnicode property, this property is set to either UTF-8 or WIDEUTF-8, otherwise the ODBCUnicode property’s setting is ignored.

See Appendix C, Internationalization and Encodings for a list of supported encodings.

See the following sections for important exceptions and additional considerations.

**Default value**

No default value defined.

**Database-specific considerations**

For DB2 or SQL Server, you should use a code page rather than an iconv encoding. For Teradata, you should override some default behavior. This section describes how to set the correct value for theStringEncoding property with these databases.

**DB2**

To determine the correct value for theStringEncoding property with a DB2 database, look up the code page that corresponds to the regional settings of the Campaign server’s operating system.

To set the value of theStringEncoding property for a DB2 database, add this command to the Campaign server startup script:

```
db2set DB2CODEPAGE=CPIBM_code_page
```

For example, to use UTF-8:

```
db2set DB2CODEPAGE=1208
```

This affects all DB2 data sources and may affect other running programs.

**SQL Server**

To determine the correct value for theStringEncoding property with a SQL Server database, look up the code page that corresponds to the regional settings of the server’s operating system.

For example, to use code page 932 (Japanese Shift-JIS):

```
StringEncoding=CP932
```

**Teradata**

Teradata supports per-column character encoding, while Campaign supports only per-data source encoding. UTF-8 cannot be used with
Campaign due to a bug in the Teradata ODBC driver. Teradata sets a default character encoding for each login. You can override this using a parameter in the ODBC data source configuration on Windows or in the odbc.ini on UNIX platforms as follows:

CharacterSet=UTF8

The default encoding for a Teradata table is LATIN. Teradata has very few built-in encodings, but it supports user-defined encodings.

The default value of the StringEncoding property is ASCII.

**Important:** For many situations involving a UTF-8 database, you should use WIDEUTF-8 pseudo-encoding, described in the WIDEUTF-8 section.

**WIDEUTF-8**

Campaign is normally responsible for transcoding between its internal encoding, UTF-8, and the encoding of the database. When the database is encoded in UTF-8, the value UTF-8 can be specified for StringEncoding (except for SQLServer), and no transcoding will be needed. Traditionally, these have been the only viable models for Campaign to access non-English data within a database.

In the 7.0 version of Campaign, a new database encoding called WIDEUTF-8 was introduced as a valid value for the StringEncoding property. By using this encoding, Campaign still uses UTF-8 to communicate with the database client, but allows the client to perform the task of transcoding between UTF-8 and the encoding of the actual database. This enhanced version of UTF-8 is needed to alter the widths of table column mappings so that they will be wide enough for transcoded text.

**Note:** The WIDEUTF-8 pseudo-encoding may be used only in the database configuration. It should not be used for any other purpose.

**Note:** Oracle does not support transcoding through the client.

**SuffixOnAllOtherSQL**

**Description**

The SuffixOnAllOtherSQL property specifies a string that is automatically appended to every SQL expression, generated by Campaign, which are not covered by the SuffixOnInsertSQL, SuffixOnSelectSQL, SuffixOnTempTableCreation, SuffixOnUserTableCreation, or SuffixOnUserBaseTableCreation properties.

This property applies only to SQL generated by Campaign, and does not apply to SQL in "raw SQL" expressions used in the Select process.

SuffixOnAllOtherSQL is used for the following expression types, when generated by Campaign:

- TRUNCATE TABLE table
- DROP TABLE table
- DELETE FROM table [WHERE ...]
- UPDATE table SET ...

This property is automatically added to the SQL expression without checking its syntax. If you use this parameter, make sure that it is a legal expression. The string may be enclosed in quotation marks, but this is not required.
This property is undefined by default.

Tokens available to SuffixOnAllOtherSQL are described below.

**Table 57. Tokens available to SuffixOnAllOtherSQL**

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AMUSER&gt;</td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNCODE&gt;</td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNNAME&gt;</td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;DBUSER&gt;</td>
<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td>&lt;FLOWCHARTNAME&gt;</td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

**Default value**

No default value defined.

**SuffixOnCreateDateField**

**Description**

The SuffixOnCreateDateField property specifies a string that Campaign automatically appends to any DATE fields in the CREATE TABLE SQL statement.

For example, you might set this property as follows:

SuffixOnCreateDateField = FORMAT 'YYYY-MM-DD'

If this property is undefined (the default), the CREATE TABLE command is unchanged.

**Note:** See the table in the description of the DateFormat property.

**Default value**

No default value defined.

**SuffixOnInsertSQL**

**Description**

The SuffixOnInsertSQL property specifies a string that is automatically appended to all INSERT SQL expressions generated by Campaign. This property applies only to SQL generated by Campaign, and does not apply to SQL in “raw SQL” expressions used in the Select process.

SuffixOnInsertSQL is used for the following expression type, when generated by Campaign:

INSERT INTO table ...
This property is automatically added to the SQL expression without checking its syntax. If you use this property, make sure that it is a legal expression. The string may be enclosed in quotation marks, but this is not required.

This property is undefined by default.

Tokens available to SuffixOnInsertSQL are described below.

Table 58. Tokens available to SuffixOnInsertSQL

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AMUSER&gt;</td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNCODE&gt;</td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNNAME&gt;</td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;DBUSER&gt;</td>
<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td>&lt;FLOWCHARTNAME&gt;</td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

Default value

No default value defined.

**SuffixOnSelectSQL**

**Description**

The SuffixOnSelectSQL property specifies a string that is automatically appended to all SELECT SQL expressions generated by Campaign. This property applies only to SQL generated by Campaign, and does not apply to SQL in “raw SQL” expressions used in the Select process.

This property is automatically added to the SQL expression without checking its syntax. If you use this property, make sure that it is a legal expression. The string may be enclosed in quotation marks, but this is not required.

This property is undefined by default.

Tokens available to SuffixOnSelectSQL are described below.

Table 59. Tokens available to SuffixOnSelectSQL

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AMUSER&gt;</td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNCODE&gt;</td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
</tbody>
</table>

<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td><code>&lt;FLOWCHARTNAME&gt;</code></td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td><code>&lt;USER&gt;</code></td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

**Default value**

No default value defined.

### SuffixOnTempTableCreation

**Description**

Use the `SuffixOnTempTableCreation` property to specify a string that is automatically appended to the SQL expression generated by Campaign when a temp table is created. This property applies only to SQL generated by Campaign, and does not apply to SQL in "raw SQL" expressions used in the Select process. To use this property, the `AllowTempTables` property must be set to `TRUE`.

You may want to use tokens to substitute the table name and the column name(s) (`<TABLENAME>` and `<KEYCOLUMNS>`) in this SQL statement, since these are generated dynamically during the execution of the campaign.

This property is automatically added to the SQL expression without checking its syntax. If you use this property, make sure that it is a legal expression. The string may be enclosed in quotation marks, but this is not required.

This property is undefined by default.

**Note:** For Oracle databases, the configuration parameter is appended to the temp table creation SQL expression after the table name.

Tokens available to `SuffixOnTempTableCreation` are described below.

### Table 60. Tokens available to SuffixOnTempTableCreation

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>

<td><code>&lt;USER&gt;</code></td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

Default value

No default value defined.

**SuffixOnSegmentTableCreation**

**Description**

Specifies a string that is automatically appended to the SQL expression generated by Campaign when a Segment temp table is created.

Tokens available to SuffixOnSegmentTableCreation are described below.

Table 61. Tokens available to SuffixOnSegmentTableCreation

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which the Segment temp table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNCODE&gt;</code></td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which the Segment temp table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which the Segment temp table was created.</td>
</tr>

**Valid Values**

Valid SQL

### SuffixOnUserBaseTableCreation

**Description**

Use the SuffixOnUserBaseTableCreation property to specify a string that is automatically appended to the SQL expression that Campaign generates when a user creates a Base table (for example, in an Extract process). This property applies only to SQL generated by Campaign, and does not apply to SQL in “raw SQL” expressions used in the Select process.

You may want to use tokens to substitute the table name and the column name(s) (`<TABLENAME>` and `<KEYCOLUMNS>`) in this SQL statement, since these are generated dynamically during the execution of the campaign.

This property is automatically added to the SQL expression without checking its syntax. If you use this property, make sure that it is a legal expression. The string may be enclosed in quotation marks, but this is not required.

This property is undefined by default.

Tokens available to SuffixOnUserBaseTableCreation are described below.

### Table 64. Tokens available to SuffixOnUserBaseTableCreation

<table>

No default value defined.

SuffixOnUserTableCreation

Description

Use the SuffixOnUserTableCreation property to specify a string that is automatically appended to the SQL expression that Campaign generates when a user creates a General table (for example, in a Snapshot process). This property applies only to SQL generated by Campaign, and does not apply to SQL in “raw SQL” expressions used in the Select process.

This property is automatically added to the SQL expression without checking its syntax. If you use this property, make sure that it is a legal expression. The string may be enclosed in quotation marks, but this is not required.

This property is undefined by default.

Tokens available to SuffixOnUserTableCreation are described below.

Table 65. Tokens available to SuffixOnUserTableCreation

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AMUSER&gt;</td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNCODE&gt;</td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNNAME&gt;</td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;DBUSER&gt;</td>
<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td>&lt;FLOWCHARTNAME&gt;</td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td>&lt;TABLENAME&gt;</td>
<td>This token is replaced with the temp table name.</td>
</tr>
</tbody>
</table>

Default value
No default value defined.
**SystemTableSchema**

**Description**

Specifies the schema used for Campaign system tables.

The default value is blank. This parameter is only relevant for the `UA_SYSTEM_TABLES` data source.

Leave this value blank unless the `UA_SYSTEM_TABLES` data source contains multiple schemas (for example, an Oracle database used by multiple groups). (In this context, “schema” indicates the initial portion of a “qualified” table name of the form \(X.Y\) (for example, `dbo.UA_Folder`). In this form, \(X\) is the schema and \(Y\) is the unqualified table name. This terminology for this syntax differs among the different database systems supported by Campaign.)

If multiple schemas exist in the system tables database, then set this value to the name of the schema in which the Campaign system tables were created.

**Default value**

No default value defined.

**TempTablePostExecutionSQL**

**Description**

Use the `TempTablePostExecutionSQL` property to specify a complete SQL statement that Campaign runs immediately after the creation of a temporary table in a user data source or in the system tables database. The `AllowTempTables` property must be set to `TRUE` to enable the creation of temp tables in a data source.

You may want to use tokens to substitute the table name and the column name(s) (`<TABLENAME>` and `<KEYCOLUMNS>`) in this SQL statement, since these are generated dynamically during the execution of the campaign.

This property is automatically added to the SQL expression without checking its syntax. If you use this property, make sure that it is a legal expression. The string may be enclosed in quotation marks, but this is not required.

The `TempTablePostExecutionSQL` property treats semicolons as delimiters to run multiple SQL statements. If your SQL statement contains semicolons and you want it to run as one statement, use a backslash as an escape character before the semicolons.

**Note:** If you are using stored procedures with the `TempTablePostExecutionSQL` property, be sure that you use the correct syntax for your database. The following example for Oracle calls a stored procedure and uses backslashes to escape the semicolon: begin
\[dbms_stats.collect_table_stats(); end;\]

Tokens available to `TempTablePostExecutionSQL` are described below.

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>
</tr>
</tbody>
</table>
Table 66. Tokens available to TempTablePostExecutionSQL (continued)

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;CAMPAIGNCODE&gt;</td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNNAME&gt;</td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td>&lt;DBUSER&gt;</td>
<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td>&lt;FLOWCHARTNAME&gt;</td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td>&lt;KEYCOLUMNS&gt;</td>
<td>This token is replaced with the temp table column name(s).</td>
</tr>
<tr>
<td>&lt;TABLENAME&gt;</td>
<td>This token is replaced with the temp table name.</td>
</tr>
<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

Default value

No default value defined.

TableListSQL

Description

Use the TableListSQL property to specify the SQL query to use to include synonyms in the list of tables available to map.

The default value is blank. This property is required if your data source is SQL Server and you want to be able to map synonyms in the returned table schema. This property is optional if you want to use a specific SQL query with other data sources in place of, or in addition to, the table schema information retrieved using the standard methods (such as an ODBC call or native connection).

Note: To ensure that Campaign works with SQL Server synonyms, you must set the UseSQLToRetrieveSchema property to TRUE in addition to setting this property as described here.

If you set this property with a valid SQL query, Campaign issues the SQL query to retrieve the list of tables for mapping. If the query returns one column, it is treated as a column of names; if the query returns two columns, the first column is assumed to be a column of owner names, and the second column is considered to be a column of table names.

If the SQL query does not begin with an asterisk (*), Campaign merges this list with the list of tables that are normally retrieved (such as through ODBC calls or native connections).

If the SQL query begins with an asterisk (*), the list returned by the SQL replaces the normal list, rather than being merged with it.

Default value

None

Valid Values
A valid SQL query

Example

If the data source is SQL Server, under normal circumstances the ODBC API call that Campaign uses returns a list of tables and views, but no synonyms. To include the list of synonyms as well, set TableListSQL similar to the following example:

```sql
select B.name AS oName, A.name AS tName
from sys.synonyms A LEFT OUTER JOIN sys.schemas B
on A.schema_id = B.schema_id ORDER BY 1, 2
```

To retrieve the list of tables, views, and synonyms, avoiding the ODBC API completely, set TableListSQL similar to the following example:

```sql
*select B.name AS oName, A.name AS tName from
(select name, schema_id from sys.synonyms UNION
select name, schema_id from sys.tables UNION select name,
schema_id from sys.views) A LEFT OUTER JOIN sys.schemas B on
A.schema_id = B.schema_id ORDER BY 1, 2
```

If the data source is Oracle, you can use a query similar to the following to retrieve the list of tables, views, and synonyms in place of the data retrieved using the native connection method that looks at the ALL_OBJECTS view:

```sql
*select OWNER, TABLE_NAME from (select OWNER, TABLE_NAME
from ALL_TABLES UNION select OWNER, SYNONYM_NAME AS TABLE_NAME
from ALL_SYNONYMS UNION select OWNER, VIEW_NAME AS TABLE_NAME from ALL_VIEWS) A ORDER BY 1, 2
```

UseSQLToRetrieveSchema

Description

Uses a SQL query, rather than an ODBC or native API call, to retrieve the schema to use as the table schema for this data source.

The default value for this property is FALSE, indicating that Campaign should use its standard method (ODBC or native connection, for example) to retrieve the schema. Setting this property to TRUE causes Campaign to prepare a SQL query similar to select * from <table> to retrieve the table schema.

This can provide advantages that are specific to each data source. For example, some data sources (Netezza, SQL Server) do not properly report SQL synonyms (alternative names for database objects, defined using the create synonym syntax) through the default ODBC or native connections. By setting this property to TRUE, SQL synonyms are retrieved for data mapping within Campaign.

The following list describes the behavior of this setting for a number of data sources:

- For Netezza, you must set this property to TRUE to allow support for synonyms. Setting this property to TRUE tells Campaign to prepare a SQL query to retrieve the table schema. No other settings or values are needed to support synonyms in Netezza data sources.
- For SQL Server, to allow support for synonyms you must set this property to TRUE and enter valid SQL in the TableListSQL property for this data source. See the description for the TableListSQL property for more details.
For Oracle data sources, setting this property to TRUE tells Campaign to prepare the SQL query to retrieve the table schema. The result set identifies NUMBER fields (no precision/scale specified, which may cause issues in Campaign) as NUMBER(38), which avoids those possible issues.

For other data sources, you can optionally set this property to TRUE to use the default SQL select query described above, or to specify valid SQL in the TableListSQL property to use instead of, or in addition to, the ODBC API or native connection that is used by default. See the description for the TableListSQL property for more details.

**Default value**

FALSE

**Valid Values**

TRUE | FALSE

**Example**

To allow Campaign to work with Netezza or SQL Server synonyms:

UseSQLToRetrieveSchema=TRUE

**UserTablePostExecutionSQL**

**Description**

Use the UserTablePostExecutionSQL property to specify a complete SQL statement that Campaign runs immediately after the creation of a user table in a user data source or in the system tables database.

You may want to use tokens to substitute the table name and the column name(s) (<TABLENAME> and <KEYCOLUMNS>) in this SQL statement, since these are generated dynamically during the execution of the campaign.

This property is automatically added to the SQL expression without checking its syntax. If you use this property, make sure that it is a legal expression. The string may be enclosed in quotation marks, but this is not required.

The UserTablePostExecutionSQL property treats semicolons as delimiters to run multiple SQL statements. If your SQL statement contains semicolons and you want it to run as one statement, use a backslash as an escape character before the semicolons.

**Note:** If you are using stored procedures with the UserTablePostExecutionSQL property, be sure that you use the correct syntax for your database. The following example for Oracle calls a stored procedure and uses backslashes to escape the semicolon:

```sql
begin
    dbms_stats.collect_table_stats;
end;
```

The tokens available to UserTablePostExecutionSQL are described below.

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AMUSER&gt;</td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which the user tables were created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNCODE&gt;</td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which the user tables were created.</td>
</tr>
</tbody>
</table>
Table 67. Tokens available to UserTablePostExecutionSQL (continued)

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;CAMPAIGNNAME&gt;</td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which the user tables were created.</td>
</tr>
<tr>
<td>&lt;DBUSER&gt;</td>
<td>This token is replaced with the database user name for the database where the user tables were created.</td>
</tr>
<tr>
<td>&lt;FLOWCHARTNAME&gt;</td>
<td>This token is replaced with the name of the flowchart associated with the user table creation.</td>
</tr>
<tr>
<td>&lt;KEYCOLUMNS&gt;</td>
<td>This token is replaced with the user table column name(s).</td>
</tr>
<tr>
<td>&lt;TABLENAME&gt;</td>
<td>This token is replaced with the user table name.</td>
</tr>
<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

Default value

No default value defined.

SegmentTablePostExecutionSQL

Description

Use the SegmentTablePostExecutionSQL property to specify a complete SQL statement that Campaign runs after a Segment temp table has been created and populated.

Tokens available to SegmentTablePostExecutionSQL are described below.

Table 68. Tokens available to SegmentTablePostExecutionSQL

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AMUSER&gt;</td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which the Segment temp table was created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNCODE&gt;</td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which the Segment temp table was created.</td>
</tr>
<tr>
<td>&lt;CAMPAIGNNAME&gt;</td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which the Segment temp table was created.</td>
</tr>
<tr>
<td>&lt;DBUSER&gt;</td>
<td>This token is replaced with the database user name for the database where the Segment temp table was created.</td>
</tr>
<tr>
<td>&lt;FLOWCHARTNAME&gt;</td>
<td>This token is replaced with the name of the flowchart associated with the Segment temp table creation.</td>
</tr>
<tr>
<td>&lt;KEYCOLUMNS&gt;</td>
<td>This token is replaced with the Segment temp table column name(s).</td>
</tr>
<tr>
<td>&lt;TABLENAME&gt;</td>
<td>This token is replaced with the Segment temp table name.</td>
</tr>
<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

Default value

Not defined

Valid Values
A valid SQL statement

**SnapshotTablePostExecutionSQL**

**Description**

Use the `SnapshotTablePostExecutionSQL` property to specify one or more complete SQL statements to run immediately after a Snapshot table has been created and populated.

Tokens available to `SnapshotTablePostExecutionSQL` are described below.

**Table 69. Tokens available to SnapshotTablePostExecutionSQL**

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which the Snapshot table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNCODE&gt;</code></td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which the Snapshot table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which the Snapshot table was created.</td>
</tr>
<tr>
<td><code>&lt;DBUSER&gt;</code></td>
<td>This token is replaced with the database user name for the database where the Snapshot table was created.</td>
</tr>
<tr>
<td><code>&lt;FLOWCHARTNAME&gt;</code></td>
<td>This token is replaced with the name of the flowchart associated with the Snapshot table creation.</td>
</tr>
<tr>
<td><code>&lt;KEYCOLUMNS&gt;</code></td>
<td>This token is replaced with the Snapshot table column name(s).</td>
</tr>
<tr>
<td><code>&lt;TABLENAME&gt;</code></td>
<td>This token is replaced with the Snapshot table name.</td>
</tr>
<tr>
<td><code>&lt;USER&gt;</code></td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

**Default value**

Not defined

**Valid Values**

A valid SQL statement

**ExtractTablePostExecutionSQL**

**Description**

Use the `ExtractTablePostExecutionSQL` property to specify one or more complete SQL statements that run immediately after the creation and population of an Extract table.

Tokens available to `ExtractTablePostExecutionSQL` are described below.

**Table 70. Tokens available to ExtractTablePostExecutionSQL**

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which the Extract table was created.</td>
</tr>
</tbody>
</table>
Table 70. Tokens available to ExtractTablePostExecutionSQL (continued)

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CAMPAIGNCODE&gt;</code></td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which the Extract table was created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which the Extract table was created.</td>
</tr>
<tr>
<td><code>&lt;DBUSER&gt;</code></td>
<td>This token is replaced with the database user name for the database where the Extract table was created.</td>
</tr>
<tr>
<td><code>&lt;FLOWCHARTNAME&gt;</code></td>
<td>This token is replaced with the name of the flowchart associated with the Extract table creation.</td>
</tr>
<tr>
<td><code>&lt;KEYCOLUMNS&gt;</code></td>
<td>This token is replaced with the Extract table column name(s).</td>
</tr>
<tr>
<td><code>&lt;TABLENAME&gt;</code></td>
<td>This token is replaced with the Extract table name.</td>
</tr>
<tr>
<td><code>&lt;USER&gt;</code></td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

Default value

Not defined

Valid Values

A valid SQL statement

TempTablePrefix

Description

The TempTablePrefix parameter specifies a string that is automatically prepended to the names of all temporary tables created by Campaign. Use this parameter to help you identify and manage your temp tables. You also can use this property to cause temp tables to be created in a particular location.

For example, if the user token corresponds to a schema, you can set TempTablePrefix="<USER>" and all temp tables will be created in the schema of whatever user is connected to the data source.

Tokens available to TempTablePrefix are described below.

Table 71. Tokens available to TempTablePrefix

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;AMUSER&gt;</code></td>
<td>This token is replaced with the IBM Unica Marketing user name associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNCODE&gt;</code></td>
<td>This token is replaced with the code for the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
<tr>
<td><code>&lt;CAMPAIGNNAME&gt;</code></td>
<td>This token is replaced with the name of the campaign associated with the flowchart for which temp tables were created.</td>
</tr>
</tbody>
</table>
Table 71. Tokens available to TempTablePrefix (continued)

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DBUSER&gt;</td>
<td>This token is replaced with the database user name for the database where the temp tables were created.</td>
</tr>
<tr>
<td>&lt;FLOWCHARTNAME&gt;</td>
<td>This token is replaced with the name of the flowchart associated with the temp table creation.</td>
</tr>
<tr>
<td>&lt;USER&gt;</td>
<td>This token is replaced with the Campaign user name of the user running the flowchart.</td>
</tr>
</tbody>
</table>

**Note:** You must make sure that the final temp table name after resolving tokens does not exceed any database-specific name length restrictions.

**Note:** In tokens used for TempTablePrefix, any characters that are not valid for database table names will be stripped. After tokens are resolved, the resulting temp table prefixes must start with an alphabetic character, and must contain only alphanumeric characters or underscore characters. Illegal characters will be removed silently. If any resulting temp table prefix does not begin with an alphabetic character, Campaign prepends the letter “U” to the prefix.

**Default value**

UAC

**TeradataDeleteBeforeDrop**

**Description**

The TeradataDeleteBeforeDrop parameter applies only to Teradata data sources. It specifies whether records are deleted before a table is dropped. Set this value to TRUE to delete all records from a table before dropping the table.

**Note:** If Campaign is unable to delete the records for any reason, it will not drop the table. Set this value to FALSE to drop a table without first deleting all records.

**Default value**

TRUE

**TruncateSQL**

**Description**

The TruncateSQL property is available for use with DB2 data sources, and allows you to specify alternate SQL for table truncation. This property applies only when DeleteAsTruncate is set to TRUE. When DeleteAsTruncate is set to TRUE, any custom SQL in this property is used to truncate a table. When this property is not set, Campaign uses the TRUNCATE TABLE <TABLENAME> syntax.

This parameter is undefined by default. Tokens available to TruncateSQL are described below.
Table 72. Tokens available to TruncateSQL

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;TABLENAME&gt;</td>
<td>This token is replaced with the database table name that Campaign is truncating.</td>
</tr>
</tbody>
</table>

**Default value**

No default value defined.

**Type**

**Description**

The partitions > partition[\(n\)] > dataSources > [data_source_name] > type property specifies the database type of this data source.

**Default value**

The default value depends on the database template used to create the data source configuration.

**Valid Values**

Valid values for system tables are:
- SQLServer
- DB2
- DB2Odbc
- ORACLE
- ORACLE8
- ORACLE9

Valid values for customer tables also include:
- SYBASE
- INFORMIX7
- INFORMIX8
- INFORMIX9
- TERADATA
- Netezza
- SAS
- SASDB

**UseExceptForMerge**

**Description**

When Campaign performs exclusions in the Merge process or in the Segment process, by default it uses "NOT EXISTS" syntax, as:

```sql
SELECT IncludeTable.ID FROM IncludeTable WHERE NOT EXISTS (SELECT * FROM ExcludeTable WHERE IncludeTable.ID = ExcludeTable.ID)
```

If UseExceptForMerge is set to TRUE and we cannot use "NOT IN" (because UseNotInForMerge is disabled, or because the audience level consists of multiple fields and the data source is not Oracle), then the syntax is altered as follows:

**Oracle**
SELECT IncludeTable.ID FROM IncludeTable
MINUS (SELECT ExcludeTable.ID FROM ExcludeTable)

Others
SELECT IncludeTable.ID FROM IncludeTable
EXCEPT (SELECT ExcludeTable.ID FROM ExcludeTable)

Default value
FALSE

Valid Values
TRUE | FALSE

UseMergeForTrack
Description
Implements SQL MERGE syntax to improve the performance of the Track process. The UseMergeForTrack property can be set to TRUE for DB2, Oracle, SQL Server 2008, and Teradata 12. It can also be used with other databases that support the SQL MERGE statement.

Default value
TRUE (DB2 and Oracle) | FALSE (all others)

Valid Values
TRUE | FALSE

UseNonANSIJoin
Description
The UseNonANSIJoin property specifies whether this data source uses non-ANSI join syntax (for example, for Oracle versions earlier than 8, and Informix8).
- If the data source type is set to Informix8, the value of UseNonANSIJoin is ignored, and non-ANSI join syntax appropriate for Informix8 is always used.
- If the data source type is set to Oracle7 or Oracle8, and the value of UseNonANSIJoin is set to TRUE, the data source uses non-ANSI join syntax appropriate for Oracle.
- If the data source type is set to Sybase, and the value of UseNonANSIJoin is set to TRUE, the data source uses non-ANSI join syntax appropriate for Sybase.

Default value
FALSE

Valid Values
TRUE | FALSE

UseNotInForMerge
Description
When Campaign performs exclusions in the Merge process or in the Segment process, by default it uses "NOT EXISTS" syntax, as:
SELECT IncludeTable.ID FROM IncludeTable WHERE NOT EXISTS (SELECT * FROM ExcludeTable WHERE IncludeTable.ID = ExcludeTable.ID)

If UseNotInForMerge is enabled (value set to YES), and either (1) the audience level is composed of a single ID field, or (2) the data source is Oracle, then the syntax is altered as follows:
SELECT IncludeTable.ID FROM IncludeTable WHERE IncludeTable.ID NOT IN (SELECT ExcludeTable.ID FROM ExcludeTable)

Default value

NO

Valid Values

YES | NO

**UseSQLToProfile**

Description

The UseSQLToProfile property allows you to configure Campaign to submit the SQL query GROUP BY to the database to compute profiles (using "SELECT field, count(*) FROM table GROUP BY field"), rather than fetching records.

- A value of FALSE (the default) causes Campaign to profile a field by retrieving the field value for all records in the table and to track the count of each distinct value.
- A value of TRUE causes Campaign to profile a field by issuing a query similar to the following:

```
SELECT field, COUNT(*) FROM table GROUP BY field
```

which pushes the burden to the database.

Default value

FALSE

Valid Values

TRUE | FALSE

**Campaign | partitions | partition[n] | systemTableMapping**

Properties in the systemTableMapping category are populated automatically if you remap any system tables or map Contact or Response history tables. You should not edit properties in this category.

**Campaign | partitions | partition[n] | server | systemCodes**

Properties in this category specify, for Campaign, whether variable length codes are allowed, the format and generator of the campaign and cell codes, whether offer codes are displayed, and the offer code delimiter.

**offerCodeDelimiter**

Description

The offerCodeDelimiter property is used internally to concatenate multiple code parts (for example, to output the OfferCode field in Campaign
Generated Fields) and for incoming offer codes in the Campaign Response process, to split the offer code into multiple parts. The value must be only a single character.

Note that in this version of Campaign, the NumberOfOfferCodesToUse parameter no longer exists. This value now comes from the offer template (every offer template can have a different number of offer codes).

Default value
- 

**allowVariableLengthCodes**

**Description**

The allowVariableLengthCodes property specifies whether variable length codes are allowed in Campaign.

If the value is yes, and if the trailing part of the code format is x, the length of the code can vary. For example, if the code format is nnnxxxx, then the code can be from 4 to 8 characters long. This applies to campaign, offer, version, tracking, and cell codes.

If the value is no, variable length codes are not allowed.

Default value
no

**Valid Values**

yes  no

**displayOfferCodes**

**Description**

The displayOfferCodes property specifies whether to show offer codes beside their names in the Campaign GUI.

If the value is yes, offer codes are displayed.

If the value is no, offer codes are not displayed.

Default value
no

**Valid Values**

yes  no

**cellCodeFormat**

**Description**

The cellCodeFormat property is used by the campaign code generator to define the format of the cell code that is automatically created by the default cell code generator.

For a list of valid values, see campCodeFormat.

Default value
Annnnnnnnnnn
campCodeFormat

Description
The campCodeFormat property is used by the campaign code generator to define the format of the campaign code that is automatically generated by the default campaign code generator when you create a campaign.

Default value
Cnnnnnnnnn

Valid Values
The possible values are as follows:
- A-Z or any symbol - treated as a constant
- a - random letters A-Z (upper case only)
- c - random letters A-Z or numbers 0-9
- n - random digit 0-9
- x - any single ASCII character from 0-9 or A-Z. You can edit the generated campaign code and replace the ASCII character that Campaign substituted for the x with any ASCII character, and Campaign will use that character instead.

cellCodeGenProgFile

Description
The cellCodeGenProgFile property specifies the name of the cell code generator, and if the generator is the default one supplied by Campaign, any supported options. Note that the properties that control the format of the code generated are set in the cellCodeFormat property. See cellCodeGenProgFile for a list of supported options.

If you write your own cell code generator, replace the default value with the absolute path of your custom program, including the file name and extension, and using forward slashes (/) for UNIX and backslashes (\) for Windows.

Default value
uaccampcodegen (the code generator supplied by Campaign)

campCodeGenProgFile

Description
The campCodeGenProgFile property specifies the name of the campaign code generator, and if the generator is the default one supplied by Campaign, any supported options.

Note that the properties that control the format of the code generated are set in the campCodeFormat property.

If you write your own campaign code generator, replace the default value with the absolute path of your custom program, including the file name and extension, and using forward slashes (/) for UNIX and backslashes (\) for Windows.

The default campaign code generator can be called with the following options:
- -y Year (four integers)
-n Month (one or two integers, cannot exceed value of twelve)
-d Day (one or two integers, cannot exceed value of 31)
-n Campaign name (any string, cannot exceed 64 characters)
-o Campaign owner (any string, cannot exceed 64 characters)
-u Campaign code (any integer). Allows you to specify the exact campaign ID rather than having the application generate one for you.
-f Code format if overriding the default. Takes the values specified in campCodeFormat.
-i Other integer.
-s Other string.

Default value
uaccampcodegen (the code generator supplied by Campaign)

**Campaign | partitions | partition[n] | server | encoding**

The property in this category specifies the text encoding for values written to files, to support non-English data.

**stringEncoding**

**Description**

The partition[n] > server> encoding > stringEncoding property how Campaign reads in and writes out flat files. It should match the encoding used for all flat files. If not configured elsewhere, this is the default setting for flat file encoding.

*Note:* WIDEUTF-8 is not supported for this setting.

By default, no value is specified, and outgoing text files are encoded as UTF-8, which is the default encoding for Campaign.

It is a best practice to explicitly set this value to an encoding appropriate for your system, even if the value is UTF-8, the same as the implicit default.

*Note:* If you do not set the value of the StringEncoding property for data sources in the dataSources category, the value of this stringEncoding property is used as the default value. This can cause unnecessary confusion -- you should always explicitly set the StringEncoding property in the dataSources category.

See the *Campaign Administrator's Guide* for a list of supported encodings.

**Default value**

No default value defined.

**forceDCTOneBytePerChar**

**Description**

The forceDCTOneBytePerChar property specifies whether Campaign should use the original field width for output files, rather than the potentially expanded width reserved to allow sufficient space for transcoding into UTF-8.
A text value may have different lengths, depending on the encoding used to represent it. When the text value comes from a data source whose `stringEncoding` property is neither ASCII nor UTF-8, Campaign reserves three times the field width in order to ensure sufficient space for transcoding into UTF-8. For example, if the `stringEncoding` property is set to `LATIN1`, and the field in the database is defined as `VARCHAR(25)`, Campaign will reserve 75 bytes to hold the transcoded UTF-8 value. Set the `forceDCTOneBytePerChar` property to `TRUE` if you want to use the original field width.

Default value

FALSE

Valid Values

TRUE | FALSE

**Campaign | partitions | partition[n] | server | timeout**

The properties in this category specify the number of seconds an Campaign flowchart waits, after the user has disconnected and all runs have completed, before exiting, and the Campaign server process waits for a response from external servers before reporting an error.

**waitForGracefulDisconnect**

Description

The `waitForGracefulDisconnect` property specifies whether the Campaign server process continues to run until the user gracefully disconnects, or exits regardless of whether the user intended to disconnect.

If the value is `yes`, the default, the server process continues to run until it can determine that the user wants it to exit. This option prevents changes from being lost, but can result in server processes accumulating.

If the value is `no`, the server process shuts down and server processes are prevented from accumulating, but users can lose work if a network interruption occurs or if they do not follow the recommended sequence of actions to exit gracefully.

Default value

yes

Valid Values

yes | no

**urlRequestTimeout**

Description

The `urlRequestTimeout` property specifies the number of seconds the Campaign server process waits for a response from external servers. Currently, this applies to requests to IBM Unica Marketing servers and eMessage components that operate with Campaign.

If the Campaign server process does not receive a response within this period, a communication timeout error is reported.

Default value
delayExitTimeout

Description
The delayExitTimeout property specifies the number of seconds an Campaign flowchart waits, after the user has disconnected and all runs have completed, before exiting.
Setting this property to a non-0 value enables subsequent Campaign flowcharts to make use of existing instances rather than starting a new instance.

Default value
10

Campaign | partitions | partition[n] | server | collaborate

collaborateInactivityTimeout

Description
The collaborateInactivityTimeout property specifies the number of seconds the unica_acsvr process waits after it finishes servicing a Distributed Marketing request before it exits. This waiting period allows the process to remain available in the typical scenario in which Distributed Marketing makes a series of requests prior to running the Flowchart.
The minimum value is 1. Setting this property to 0 causes it to default to 60.

Default value
60

Campaign | partitions | partition[n] | server | permissions

The properties in this category specify the permissions set on folders created by Campaign, and the UNIX group and permissions set on files contained in the profile directory.

userFileGroup (UNIX only)

Description
The userFileGroup property specifies a group associated with user-generated Campaign files. The group will be set only if the user is a member of the specified group.
This property is undefined by default.

Default value
No default value defined.

catalogFolderPermissions

Description
The catalogFolderPermissions property specifies the permissions of directories created by Campaign through the Stored Table Catalogs > Create Folder window.
Default value
755 (owner has read/write/execute access, group and world have execute/read access)

templateFolderPermissions
Description
The templateFolderPermissions property specifies the permissions of template directories created by Campaign through the Stored Templates > Create Folder window.
Default value
755 (owner has read/write/execute access, group and world have read/execute access)

adminFilePermissions (UNIX only)
Description
The adminFilePermissions property specifies a permission bit mask for the files contained in the profile directory.
Default value
660 (owner and group have read/write access only)

userFilePermissions (UNIX only)
Description
The userFilePermissions property specifies a permission bit mask for user generated Campaign files (for example, log files, summary files, exported flat files).
Default value
666 (everyone can read and write files created by Campaign in the server)

adminFileGroup (UNIX only)
Description
The adminFileGroup property specifies a UNIX admin group associated with files contained in the profile directory.
This property is undefined by default.
Default value
No default value defined.

Campaign | partitions | partition[n] | server | flowchartConfig

Properties in this category specify the behavior of the Campaign Generated Field, whether duplicate cell codes are allowed, and whether the Log to Contact History option defaults to enabled.

allowDuplicateCellcodes
Description
The allowDuplicateCellcodes property specifies whether the cell codes in the Campaign Snapshot process can have duplicate values.
If the value is no, the Campaign server enforces unique cell codes.
If the value is yes, the Campaign server does not enforce unique cell codes.

**Default value**

*yes*

**allowResponseNDaysAfterExpiration**

**Description**

The `allowResponseNDaysAfterExpiration` property specifies the maximum number of days after all offer expiration dates that responses can be tracked. These late responses can be included in performance reports.

**Default value**

*90*

**agfProcessnameOutput**

**Description**

The `agfProcessnameOutput` property specifies the output behavior of the Campaign Generated Field (UCGF) in the List, Optimize, Response, and Snapshot processes.

If the value is `PREVIOUS`, the UCGF contains the process name associated with the incoming cell.

If the value is `CURRENT`, the UCGF holds the process name of the process in which it is used.

**Default value**

*PREVIOUS*

**Valid Values**

`PREVIOUS | CURRENT`

**logToHistoryDefault**

**Description**

The `logToHistoryDefault` property specifies whether the Log to Contact History and Tracking Tables option in the Log tab of the Campaign contact processes defaults to enabled.

If the value is yes, the option is enabled.

If the value is no, the option is disabled in any newly created contact processes.

**Default value**

*yes*

**Valid Values**

*yes | no*

**defaultBehaviorWhenOutputToFile**

**Description**
Specifies the behavior for contact processes in Campaign when outputting to a file. This property applies only within the current partition. This default behavior (if set) is only applied for processes when they are newly added to flowcharts; once a process is added to a flowchart, the output behavior can be changed in the process configuration.

**Default value**
- Replace All Records

**Valid Values**
- Append to Existing Data
- Create New File
- Replace All Records

### defaultBehaviorWhenOutputToDB

**Description**
Specifications the behavior for contact processes in Campaign when outputting to a database table. This property applies only within the current partition. This default behavior (if set) is only applied for processes when they are newly added to flowcharts; once a process is added to a flowchart, the output behavior can be changed in the process configuration.

**Default value**
- Replace All Records

**Valid Values**
- Append to Existing Data
- Replace All Records

### replaceEmbeddedNames

**Description**
When replaceEmbeddedNames is TRUE, Campaign replaces user variable and UCGF names embedded in query text with actual values, although these names must be separated by a non-alphanumeric character, such as an underscore (for example, ABC_UserVar.v1 will be substituted but ABCUserVar.v1 will not). Set this property to TRUE for backwards compatibility with Campaign 7.2 and earlier.

When set to FALSE, Campaign replaces only distinct user variable and UCGF names with actual values (in both Unica and raw SQL expressions). Set this property to FALSE for backwards compatibility with Campaign 7.3 and higher.

**Default value**
- FALSE

**Valid Values**
- TRUE | FALSE

### Campaign | partitions | partition[n] | server | flowchartSave

The properties in this category specify the default settings for a new Campaign flowchart’s auto-save and checkpoint properties.
checkpointFrequency

Description
The checkpointFrequency property specifies (in minutes) the default setting for a new Campaign flowchart’s checkpoint property, configurable for each flowchart through the client-side Advanced Settings window. The checkpoint feature provides the ability to capture a snapshot of a running flowchart for recovery purposes.

Default value
0 (zero)

Valid Values
Any integer

autosaveFrequency

Description
The autosaveFrequency property specifies (in minutes) the default setting for a new Campaign flowchart’s auto-save property, configurable for each flowchart through the client-side Advanced Settings window. The auto-save function performs a forced save of flowcharts during editing and configuration.

Default value
0 (zero)

Valid Values
Any integer

Campaign | partitions | partition[n] | server | dataProcessing

Properties in the this category specify how Campaign handles string comparisons and empty fields in flat files, and the behavior of the macro STRING_CONCAT.

longNumericIdsAsText

Description
The longNumericIdsAsText property specifies whether the Campaign macro language will treat numeric IDs longer than 15 digits as text.

Set the value to yes to specify that numeric IDs longer than 15 digits will be treated as text.

Set the value to no to specify that numeric IDs longer than 15 digits are treated as numeric values (and thus might lose precision or uniqueness if truncated or rounded).

Note: This setting is ignored if the partitions > partition[n] > dataSources > [data_source_name] > ForceNumeric property is set to TRUE for fields coming from this data source.

Default value
no

Valid Values
yes | no
**stringConcatWithNullIsNull**

**Description**

The `stringConcatWithNullIsNull` property controls the behavior of the Campaign macro `STRING_CONCAT`.

When the value is `yes`, `STRING_CONCAT` returns `NULL` if any of its inputs is `NULL`.

When the value is `no`, `STRING_CONCAT` returns the concatenation of all of its non-`NULL` properties; in this case, `STRING_CONCAT` returns `NULL` only if all of its inputs are `NULL`.

**Default value**

`yes`

**Valid Values**

`yes` | `no`

**performCaseInsensitiveComparisonAs**

**Description**

The `performCaseInsensitiveComparisonAs` property specifies how Campaign compares data values when the `compareCaseSensitive` property is set to `no` (that is, during case-insensitive comparisons). This property is ignored if the value of `compareCaseSensitive` is `yes`.

When the value is `UPPER`, Campaign converts all data to upper case before comparing.

When the value is `LOWER`, Campaign converts all data to lower case before comparing.

**Default value**

`LOWER`

**Valid Values**

`UPPER` | `LOWER`

**upperAllowsDate**

**Description**

The `upperAllowsDate` property specifies whether the `UPPER` database function allows a `DATE/DATETIME` parameter, and therefore whether the operation may be performed in the database or must be performed by the Campaign server.

Set the value to `yes` if the database is SQL Server or Oracle. The `UPPER` function in these databases allows a `DATE/DATETIME` parameter.

Set the value to `no` if the database is DB2, Teradata, Sybase, or Informix. The `UPPER` function in these databases does not allow a `DATE/DATETIME` parameter.

Note that this setting is global, not per data source. If a value of `no` is recommended for any data source in use, set the value to `no`. If a value of `yes` is recommended for all data sources in use, set the value to `yes`.

**Default value**
**compareCaseSensitive**

**Description**

The `compareCaseSensitive` property specifies whether the Campaign data comparisons are sensitive to alphabetic case (UPPER vs. lower).

When the value is `no`, Campaign ignores case differences when comparing data values and sorts textual data in a binary, case-insensitive manner. This setting is strongly recommended when English data is used.

When the value is `yes`, Campaign distinguishes data values based on case differences, performing a true binary-value comparison of each character. This setting is strongly recommended when non-English data is used.

**Default value**

`no`

**Valid Values**

`yes` | `no`

---

**lowerAllowsDate**

**Description**

The `lowerAllowsDate` property specifies whether the `LOWER` database function allows a `DATE/DATETIME` parameter, and therefore whether the operation may be performed in the database or must be performed by the Campaign server.

Set the value to `yes` if the database is SQL Server or Oracle. The `LOWER` function in these databases allows a `DATE/DATETIME` parameter.

Set the value to `no` if the database is DB2, Teradata, Sybase, or Informix. The `LOWER` function in these databases does not allow a `DATE/DATETIME` parameter.

Note that this setting is global, not per data source. If a value of `no` is recommended for any data source in use, set the value to `no`. If a value of `yes` is recommended for all data sources in use, set the value to `yes`.

Typically, only one database type is in use at a customer site, but there are some installations in which multiple database types are in use.

**Default value**

`yes`

**Valid Values**

`yes` | `no`

---

**substrAllowsDate**

**Description**
The `substrAllowsDate` property specifies whether the `SUBSTR/SUBSTRING` database function allows a `DATE/DATETIME` parameter, and therefore whether the operation may be performed in the database or must be performed by the Campaign server.

Set the value to `yes` if the database is Oracle or Teradata. The `SUBSTR/SUBSTRING` function in these databases allows a `DATE/DATETIME` parameter.

Set the value to `no` if the database is SQL Server, DB2, Sybase, or Informix. The `SUBSTR/SUBSTRING` function in SQL Server, DB2, and Sybase does not allow a `DATE/DATETIME` parameter. Informix `SUBSTR` does accept a `DATE` parameter, but the `DATE` is first converted to text, and the conversion changes the format. So `SUBSTR` would return different results in the database compared with the Campaign server, so the best practice is to set `substrAllowsDate` to `no` when the database is Informix.

Note that this setting is global, not per data source. If a value of `no` is recommended for any data source in use, set the value to `no`. If a value of `yes` is recommended for all data sources in use, set the value to `yes`.

Default value

*yes*

Valid Values

`yes | no`

---

### ltrimAllowsDate

**Description**

The `ltrimAllowsDate` property specifies whether the `LTRIM` database function allows a `DATE/DATETIME` parameter, and therefore whether the operation may be performed in the database or must be performed by the Campaign server.

Set the value to `yes` if the database is SQL Server, Oracle, or Teradata. The `LTRIM` function in these databases allows a `DATE/DATETIME` parameter.

Set the value to `no` if the database is DB2, Sybase, or Informix. The `LTRIM` function in these databases does not allow a `DATE/DATETIME` parameter.

Note that this setting is global, not per data source. If a value of `no` is recommended for any data source in use, set the value to `no`. If a value of `yes` is recommended for all data sources in use, set the value to `yes`.

Typically, only one database type is in use at a customer site, but there are some installations in which multiple database types are in use.

Default value

*yes*

Valid Values

`yes | no`

---

### rtrimAllowsDate

**Description**

The `rtrimAllowsDate` property specifies whether the `RTRIM` database function allows a `DATE/DATETIME` parameter, and therefore whether the operation may be performed in the database or must be performed by the Campaign server.

Set the value to `yes` if the database is SQL Server, Oracle, or Teradata. The `RTRIM` function in these databases allows a `DATE/DATETIME` parameter.

Set the value to `no` if the database is DB2, Sybase, or Informix. The `RTRIM` function in these databases does not allow a `DATE/DATETIME` parameter.

Note that this setting is global, not per data source. If a value of `no` is recommended for any data source in use, set the value to `no`. If a value of `yes` is recommended for all data sources in use, set the value to `yes`.

Typically, only one database type is in use at a customer site, but there are some installations in which multiple database types are in use.

Default value

*yes*

Valid Values

`yes | no`
The `rtrimAllowsDate` property specifies whether the RTRIM database function allows a DATE/DATETIME parameter, and therefore whether the operation may be performed in the database or must be performed by the Campaign server.

Set the value to `yes` if the database is SQL Server, Oracle, or Teradata. The RTRIM function in these databases allows a DATE/DATETIME parameter.

Set the value to `no` if the database is DB2, Sybase, or Informix. The RTRIM function in these databases does not allow a DATE/DATETIME parameter.

Note that this setting is global, not per data source. If a value of `no` is recommended for any data source in use, set the value to `no`. If a value of `yes` is recommended for all data sources in use, set the value to `yes`.

Default value

`yes`

Valid Values

`yes | no`

**likeAllowsDate**

**Description**

The `likeAllowsDate` property specifies whether the LIKE database function allows a DATE/DATETIME parameter, and therefore whether the operation may be performed in the database or must be performed by the Campaign server.

Set the value to `yes` if the database is SQL Server or Oracle. The LIKE function in these databases allows a DATE/DATETIME parameter.

Set the value to `no` if the database is DB2, Teradata, Sybase, or Informix. The LIKE function in these databases does not allow a DATE/DATETIME parameter.

Note: This setting is global, not per data source. If a value of `no` is recommended for any data source in use, set the value to `no`. If a value of `yes` is recommended for all data sources in use, set the value to `yes`.

Default value

`yes`

Valid Values

`yes | no`

**fileAllSpacesIsNull**

**Description**

The `fileAllSpacesIsNull` property controls how Campaign interprets an empty field in a mapped flat file by specifying whether an all-spaces value in a flat file should be considered to be a NULL value.

When the value is `yes`, an all-spaces value is considered to be a NULL value. Campaign matches queries such as `<field> is null`, but fails queries such as `<field> = ""`. 
When the value is no, an all-spaces value is treated as a non-NULL empty string. Campaign matches queries such as \(<\text{field}> = "\"\"\rangle", but fails \(<\text{field}> is \text{null}\).

Default value

yes

Valid Values

yes | no

**Campaign | partitions | partition[n] | server | optimization**

Properties in this category control Campaign server optimization for partitions.

**Note:** This category of parameters is not related to Optimize.

**maxVirtualMemory**

**Description**

The \(\text{maxVirtualMemory}\) property specifies a default setting for a new Campaign flowchart’s Affinium Virtual Memory Usage property, configurable for each flowchart through the client-side Advanced Settings window. The units are in megabytes.

Default value

128

**useInDbOptimization**

**Description**

The \(\text{useInDbOptimization}\) property specifies whether Campaign tries to perform as many operations as possible in the database instead of in the Campaign server.

If the value is no, Campaign maintains lists of IDs in the Campaign server at all times.

If the value is yes, Campaign avoids pulling the ID lists if possible.

Default value

no

Valid Values

yes | no

**maxReuseThreads**

**Description**

The \(\text{maxReuseThreads}\) property specifies the number of operating system threads cached by the server process (\(\text{unica\_acsvr}\)) for reuse. By default, the cache is disabled as this property is set to 0.

It is a best practice to use the cache when you want to reduce the overhead of thread allocation, or with operating systems that can exhibit an inability to release threads when asked to do so by an application.

Note that when the \(\text{maxReuseThreads}\) property is set to a non-zero value, it should be greater than or equal to the value of \(\text{MaxQueryThreads}\).
Default value

0 (zero), which disables the cache

**threadStackSize**

**Description**

The `threadStackSize` determines the number of bytes allocated for each thread’s stack. This property should be changed only under guidance from IBM. The minimum value is 128K. The maximum value is 8MB.

**Default value**

1048576

**tempTableDataSourcesForSegments**

**Description**

The `tempTableDataSourcesForSegments` property defines the list of data sources where persistent Segment temp tables should be created by the Create Seg process. This list is comma-separated.

By default, this property is blank.

**Default value**

No default value defined.

**doNotCreateServerBinFile**

**Description**

When this option is set to TRUE, strategic segments will not create binary files on the Campaign server; instead, strategic segments create Segment temp tables in the data source. When the value is set to TRUE, at least one data source must be specified in the Create Seg process configuration.

**Default value**

FALSE

**Valid Values**

TRUE | FALSE

**forceViewForPreOptDates**

**Description**

The default value (TRUE) forces creation of a parameterized offer attribute view in a Mail List process whose offers are assigned from Optimize. A value of FALSE causes the parameterized offer attribute view to be created only if the Mail List exports at least one parameterized offer attribute.

If this value is set to FALSE, a Mail List process configured to get its input from an Extract process (whose source is an Optimize session) may write NULL values for EffectiveDate and ExpirationDate into the UA_Treatment table, even when the offer includes parameterized Effective and Expiration Dates. In this case, set it back to TRUE.

**Default value**

TRUE

**Valid Values**
TRUE | FALSE

Campaign | partitions | partition[n] | server | logging

Properties in this category specify, for the Campaign server, whether standard and Windows event logging are enabled, logging levels and categories, and other logging behavior.

**enableWindowsEventLogging**

Description

The `enableWindowsEventLogging` property enables or disables Campaign server logging to the Windows event log.

If the value is `yes`, logging to the Windows event log is enabled.

If the value is `no`, logging to the Windows event log is disabled. If disabled, the `windowsEventLoggingLevel` and `windowsEventLoggingCategory` settings are ignored.

**Default value**

`no`

**Valid Values**

`yes` | `no`

**logFileBufferSize**

Description

The `logFileBufferSize` property is used when the value of the `keepFlowchartLogOpen` property is `yes`. It sets an upper bound on the number of log messages after which the messages will be written to file.

If the value is 1, every log message is written immediately to file, effectively disabling buffering but causing somewhat worse performance.

This property is ignored if the value of `keepFlowchartLogOpen` is set to `no`.

**Default value**

`5`

**keepFlowchartLogOpen**

Description

The `keepFlowchartLogOpen` property specifies whether Campaign opens and closes the flowchart log file each time a line is written to the log file.

If the value is `no`, Campaign opens and closes the flowchart log file.

If the value is `yes`, Campaign opens the flowchart log file only once, and closes the flowchart log file only when the flowchart's server process exits. A value of `yes` may improve performance of real-time flowcharts. A side effect of using the `yes` setting is that recently-logged messages may not be immediately visible in the log file, as Campaign flushes the log messages to file only when its internal buffer becomes full or when the number of logged messages equals the value of the `logFileBufferSize` property.

**Default value**

`no`
Valid Values

yes | no

**logProcessId**

**Description**
The logProcessId property controls whether the process ID (pid) of the Campaign Server process is logged in the log file.
- If the value is **yes**, the process ID is logged.
- If the value is **no**, the process ID is not logged.

**Default value**

**yes**

**Valid Values**

yes | no

**logMaxBackupIndex**

**Description**
The logMaxBackupIndex property specifies the number of backup Campaign server log files that are kept before the oldest is erased.
- If the value is 0 (zero), no backup files are created, and the log file is truncated when it reaches the size specified by the logFileMaxSize property.
- For a value of n, where n is greater than zero, the files {File.1, ..., File.n-1} are renamed to {File.2, ..., File.n}. Also, File is renamed File.1 and closed. A new File is created to receive further log output.

**Default value**

1 (creates one backup log file)

**loggingCategories**

**Description**
The loggingCategories property specifies the category of messages written to the Campaign server log file. This works in conjunction with loggingLevels, which determines which messages are logged based on severity (for all selected categories). You can specify multiple categories in a comma-separated list. The special category all provides a shorthand for specifying all logging categories.

**Default value**

**ALL**

**Valid Values**

Supported categories are:
- **ALL**
- **BAD_ORDER**
- **CELL_ACCESS**
- **CONFIG**
- **DATA_ERRORS**
loggingLevels

Description
The loggingLevels property controls the amount of detail written to the Campaign server log file, based on severity.

Default value
MEDIUM

Valid Values
- LOW
- MEDIUM
- HIGH
- ALL

LOW represents the least detail (the most severe errors only), and ALL includes trace messages and is intended primarily for diagnostic purposes. You can adjust these settings from within a flowchart through the Tools > Logging Options menu.

Note: You may want to set the loggingLevels property to ALL during configuration and testing, to maximize the logging output from Campaign for diagnostic purposes. This setting generates a large amount of data and therefore may not be advisable for production operation.

windowsEventLoggingCategories

Description
The windowsEventLoggingCategories property specifies the category of messages written to the Campaign server windows event log. This works in conjunction with windowsEventLoggingLevels, which determines which messages are logged based on severity (for all selected categories).

You can specify multiple categories in a comma-separated list. The special category all provides a shorthand for specifying all logging categories.

Default value
ALL

Valid Values
logFileMaxSize

Description

The logFileMaxSize property specifies the maximum size, in bytes, that the Campaign server log file is allowed to reach before being rolled over to backup files.

Default value

10485760 (10 MB)

windowsEventLoggingLevels

Description

The windowsEventLoggingLevels property controls the amount of detail written to the Campaign server windows event log based on severity.

Default value

MEDIUM

Valid Values

- LOW
- MEDIUM
- HIGH
- ALL

LOW represents the least detail (the most severe errors only), and ALL includes trace messages and is intended primarily for diagnostic purposes.

enableLogging

Description

The enableLogging property specifies whether Campaign server logging is turned on at session startup.
If the value is yes, logging is turned on.
If the value is no, logging is turned off.

Default value
yes

Valid Values
yes | no

Campaign | partitions | partition[n] | server | flowchartRun

Properties in this category specify how many errors are allowed in a Campaign Snapshot export, what files are saved when you save a flowchart, and the maximum number of IDs for each top-level process in a test run.

**maxDataErrorsAllowed**

Description
The `maxDataErrorsAllowed` property specifies the maximum number of data conversion errors allowed in a Campaign Snapshot export.

Default value
0 (zero), which allows no errors

**saveRunResults**

Description
The `saveRunResults` property specifies what files are saved when you save an Campaign flowchart.

If the value is yes, the “underscore” files are saved and, if the value of `useInDbOptimization` is yes, database temp tables persist.

If the value is no, only the .ses file is saved and you cannot view intermediate results if you reload the flowchart.

Default value
yes

Valid Values
yes | no

**testRunDefaultSize**

Description
The `testRunDefaultSize` property specifies the default maximum number of IDs for each top-level process in a Campaign test run. A value of 0 (zero) removes the limitation on the number of IDs.

Default value
0 (zero)

Campaign | partitions | partition[n] | server | profile

Properties in this category specify the maximum number of categories created during profiling for numeric and text values in Campaign.
**profileMaxTextCategories**

**Description**

The `profileMaxTextCategories` and `profileMaxNumberCategories` properties specify the maximum number of categories created in Campaign during profiling for text and numeric values, respectively.

These values are different from the setting for the number of bins displayed to the user, which can be modified through the user interface.

**Default value**

1048576

**profileMaxNumberCategories**

**Description**

The `profileMaxNumberCategories` and `profileMaxTextCategories` properties specify the maximum number of categories created in Campaign during profiling for numeric and text values, respectively.

These values are different from the setting for the number of bins displayed to the user, which can be modified through the user interface.

**Default value**

1024

**Campaign | partitions | partition[n] | server | internal**

Properties in this category specify integration settings and the internalID upper and lower limits for the selected Campaign partition. If your Campaign installation has multiple partitions, set these properties for each partition that you want to affect.

**internalIdLowerLimit**

**Description**

The `internalIdUpperLimit` and `internalIdLowerLimit` properties constrain the Campaign internal IDs to be within the specified range. Note that the values are inclusive: that is, Campaign may use both the lower and upper limit.

**Default value**

0 (zero)

**internalIdUpperLimit**

**Description**

The `internalIdUpperLimit` and `internalIdLowerLimit` properties constrain the Campaign internal IDs to be within the specified range. Note that the values are inclusive: that is, Campaign may use both the lower and upper limit.

**Default value**

4294967295
eMessageInstalled
Description
Indicates that eMessage is installed. When you select yes, eMessage features are available in the Campaign interface.
The IBM installer sets this property to yes for the default partition in your eMessage installation. For additional partitions where you have installed eMessage, you must configure this property manually.

Default value
no

Valid Values
yes | no

interactInstalled
Description
After installing the Interact design environment, this configuration property should be set to yes to enable the Interact design environment in Campaign.
If you do not have Interact installed, set to no. Setting this property to no does not remove Interact menus and options from the user interface. To remove menus and options, you must manually unregister Interact using the configTool utility.

Default value
no

Valid Values
yes | no

Availability
This property is applicable only if you have installed Interact.

MO_UC_integration
Description
Enables integration with Marketing Operations for this partition. If you plan to set any of the following three options to Yes, you must set MO_UC_integration to Yes.

Default value
no

Valid Values
yes | no

MO_UC_BottomUpTargetCells
Description
Allows bottom-up cells for Target Cell Spreadsheets on this partition. When set to Yes, both top-down and bottom-up target cells are visible, but bottom-up target cells are read only. Note that MO_UC_integration must be enabled.
**Legacy_campaigns**

*Description*

When the `MO_UC_integration` property is set to `Yes`, the `Legacy_campaigns` property enables access to campaigns created before enabling integration, including campaigns created in Campaign 7.x and linked to Plan 7.x projects.

*Default value*

no

*Valid Values*

yes | no

---

**IBM Unica Marketing Operations - Offer integration**

*Description*

Enables the ability to use Marketing Operations to perform offer lifecycle management tasks on this partition. (`MO_UC_integration` must be enabled. Also, `Campaign integration` must be enabled in `Settings > Configuration > Unica > Platform`.)

*Default value*

no

*Valid Values*

yes | no

---

**Campaign | partitions | partition[n] | server | fileDialog**

Properties in this category specify the default directories for Campaign input and output data files.

**defaultOutputDirectory**

*Description*

The `defaultOutputDirectory` property specifies the path used to initialize the Campaign File Selection dialog. The `defaultOutputDirectory` property is used when an output data file is mapped into Campaign. If no value is specified, the path is read from the environment variable `UNICA_ACDFDIR`.

*Default value*

No default value defined.

**defaultInputDirectory**

*Description*

The `defaultInputDirectory` property specifies the path used to initialize the Campaign File Selection dialog. The `defaultInputDirectory` property is
used when an input data file is mapped into Campaign. If no value is specified, the path is read from the environment variable UNICA_ACDFDIR.

Default value
No default value defined.

**Campaign | partitions | partition[n] | offerCodeGenerator**

Properties in this category specify the class, classpath, and configuration string for the offer code generator, and also the cell code generator used to assign a contact process to a Target Cell Spreadsheet cell.

**offerCodeGeneratorClass**

**Description**
The offerCodeGeneratorClass property specifies the name of the class Campaign uses as its offer code generator. The class must be fully qualified with its package name.

Default value
Note that line breaks have been added for print.
com.unica.campaign.core.codegenerator.samples.ExecutableCodeGenerator

**offerCodeGeneratorConfigString**

**Description**
The offerCodeGeneratorConfigString property specifies a string that is passed into the offer code generator plug-in when it is loaded by Campaign. By default, the ExecutableCodeGenerator (shipped with Campaign) uses this property to indicate the path (relative to Campaign application home directory) to the executable to run.

Default value
./bin

**defaultGenerator**

**Description**
The defaultGenerator property specifies the generator for the cell codes that appear in contact-style process boxes and are used to assign cells to Target Control Spreadsheet cells. The Target Control Spreadsheet manages cell and offer mappings for campaigns and flowcharts.

Default value
uacoffercodegen.exe

**offerCodeGeneratorClasspath**

**Description**
The offerCodeGeneratorClasspath property specifies the path to the class Campaign uses as its offer code generator. It can be either a full path or a relative path.

If the path ends in a slash (forward slash / for UNIX or backslash \ for Windows), Campaign assumes it to be a path to a directory that contains
the Java plug-in class that should be used. If the path does not end in a slash, Campaign assumes it is the name of a jar file that contains the Java class.

If the path is relative, Campaign assumes it is relative to the Campaign application home directory.

Default value
codeGenerator.jar (packaged in the Campaign.war file)

Campaign | monitoring

Properties in this category specify whether the Operational Monitoring feature is enabled, the URL of the Operational Monitoring server, and caching behavior. Operational Monitoring displays and allows you to control active flowcharts.

**cacheCleanupInterval**

Description
The cacheCleanupInterval property specifies the interval, in seconds, between automatic cleanups of the flowchart status cache.

This property is not available in versions of Campaign earlier than 7.0.

Default value
600 (10 minutes)

**cacheRunCompleteTime**

Description
The cacheRunCompleteTime property specifies the amount of time, in minutes, that completed runs are cached and display on the Monitoring page.

This property is not available in versions of Campaign earlier than 7.0.

Default value
4320

**monitorEnabled**

Description
The monitorEnabled property specifies whether the monitor is turned on.

This property is not available in versions of Campaign earlier than 7.0.

Default value
yes

**serverURL**

Description
The Campaign > monitoring > serverURL property specifies the URL of the Operational Monitoring server. This is a mandatory setting; modify the value if the Operational Monitoring server URL is not the default.
If Campaign is configured to use Secure Sockets Layer (SSL) communications, set the value of this property to use HTTPS. For example:

```plaintext
serverURL=https://host:SSL_port/Campaign/OperationMonitor
```

- *host* is the name or IP address of the machine on which the web application is installed
- *SSL_Port* is the SSL port of the web application.

Note the https in the URL.

**Default value**

```plaintext
http://localhost:7001/Campaign/OperationMonitor
```

**monitorEnabledForInteract**

**Description**

If set to *yes*, enables Campaign JMX connector server for Interact. Campaign has no JMX security.

If set to *no*, you cannot connect to the Campaign JMX connector server.

This JMX monitoring is for the Interact contact and response history module only.

**Default value**

False

**Valid Values**

True | False

**Availability**

This property is applicable only if you have installed Interact.

**protocol**

**Description**

Listening protocol for the Campaign JMX connector server, if *monitorEnabledForInteract* is set to *yes*.

This JMX monitoring is for the Interact contact and response history module only.

**Default value**

JMXMP

**Valid Values**

JMXMP | RMI

**Availability**

This property is applicable only if you have installed Interact.

**port**

**Description**

Listening port for the Campaign JMX connector server, if *monitorEnabledForInteract* is set to *yes*.

This JMX monitoring is for the Interact contact and response history module only.
Default value
2004

Valid Values
An integer between 1025 and 65535.

Availability
This property is applicable only if you have installed Interact.

Campaign | ProductReindex

The creator of an offer can specify the products that are associated with that offer. When the list of products available for association with offers changes, the offer/product associations must be updated. Properties in the Campaign > ProductReindex category specify the frequency of these updates and the time of day that the first update runs.

startTime
Description
The startTime property specifies the time of day when offer/product associations are updated for the first time. The first update occurs on the day after the Campaign server is started, and subsequent updates occur at intervals specified in the interval parameter. The format is HH:mm:ss, using a 24-hour clock.

Note that when Campaign first starts up, the startTime property is used according to the following rules:
• If the time of day specified by startTime is in the future, the first offer/product associations update will occur at startTime of the current day.
• If startTime is in the past for the current day, the first update will occur at startTime tomorrow, or at interval minutes from the current time, whichever is earlier.

Default value
12:00:00 (noon)

interval
Description
The interval property specifies the time, in minutes, between updates of offer/product associations. The update occurs for the first time at the time specified in the startTime parameter, on the day after the Campaign server is started.

Default value
3600 (60 hours)

Campaign | unicaACLListener

Properties in this category affect the Campaign listener. These properties need to be set only once per instance of Campaign; they do not need to be set for every partition.
enableWindowsImpersonation
Description
The enableWindowsImpersonation property specifies whether Windows Impersonation is enabled in Campaign. Windows Impersonation in Campaign, is explained in the Campaign Administrator’s Guide.
Set the value to TRUE to use Windows Impersonation.
Set the value to FALSE if Windows Impersonation is not used.
Default value
FALSE
Valid Values
TRUE | FALSE

enableWindowsEventLogging
Description
The Campaign > unicaACListener > enableWindowsEventLogging property controls logging to the Windows event log. Set this property to TRUE to log to the Windows event log.
Default value
FALSE
Valid Values
TRUE | FALSE

serverHost
Description
The serverHost property specifies the name or IP address of the machine where the Campaign listener is installed. If the Campaign listener is not installed on the same machine where IBM Unica Marketing is installed, change the value to the machine name or IP address of the machine where the Campaign listener is installed.
Default value
localhost

logMaxBackupIndex
Description
The logMaxBackupIndex property specifies how many backup files can exist before the oldest one is deleted. If you set this property to 0 (zero), Campaign does not create any backup files and the log file stops logging when it reaches the size specified in the logMaxFileSize property.
If you specify a number (N) for this property, when the log file reaches the size specified in the logMaxFileSize property, Campaign renames the existing backup files (File.1 ... File.N-1) to File.2 ... File.N, renames the current log file File.1, closes it, and starts a new log file named File.
Default value
logStringEncoding

**Description**

The logStringEncoding property controls the encoding used for all log files. This value should match the encoding used on the operating system. For multi-locale environments, UTF-8 is the preferred setting.

If you change this value, you should empty or remove all affected log files to prevent writing multiple encodings into a single file.

**Note:** WIDEUTF-8 is not supported for this setting.

**Default value**

native

**Valid Values**

See the Campaign Administrator’s Guide for a list of supported encodings.

systemStringEncoding

**Description**

The systemStringEncoding property specifies the encodings used to interpret values coming into Campaign from the operating system (file system paths and filenames, for example), as well as the encoding in which Campaign presents values back to the operating system. This value should be generally be set to native. For multi-locale environments, UTF-8 is the preferred setting.

The value can include more than one encoding, separated by commas: for example,

UTF-8,ISO-8859,CP950

**Note:** WIDEUTF-8 is not supported for this setting.

**Default value**

native

**Valid Values**

See the Campaign Administrator’s Guide for a list of supported encodings.

loggingLevels

**Description**

The Campaign > unicaACLlistener > loggingLevels property controls the amount of detail written to the log file.

**Default value**

MEDIUM

**Valid Values**

- LOW
- MEDIUM
- HIGH
**maxReuseThreads**

**Description**

The `Campaign > unicaACLisnter > maxReuseThreads` property sets the number of operating system threads cached by the Campaign listener process (`unica_aclsnr`) for reuse.

It is a best practice to use the cache when you want to reduce the overhead of thread allocation, or with operating systems that can exhibit an inability to release threads when asked to do so by an application.

**Default value**

0 (zero), which disables the cache

**threadStackSize**

**Description**

The `threadStackSize` determines the number of bytes allocated for each thread's stack. This property should be changed only under guidance from IBM. The minimum value is 128K. The maximum value is 8MB.

**Default value**

262144

**logMaxFileSize**

**Description**

The `logMaxFileSize` property specifies the maximum size, in bytes, that the log file can reach before rolling into the backup file.

**Default value**

10485760 (10 MB)

**windowsEventLoggingLevels**

**Description**

The `windowsEventLoggingLevels` property controls the amount of detail written to the Windows event log file based on severity.

**Default value**

MEDIUM

**Valid Values**

- LOW
- MEDIUM
- HIGH
- ALL

The ALL level includes trace messages intended for diagnostic purposes.

**serverPort**

**Description**

The `serverPort` property specifies the port where the Campaign listener is installed.

**Default value**
**useSSL**

Description

The `useSSL` property specifies whether to use Secure Sockets Layer for communications between the Campaign listener and the Campaign web application.

Default value

no

Valid Values

yes | no

**keepalive**

Description

Use the `keepalive` property to specify, in seconds, the frequency with which the Campaign web application server sends keep alive messages on otherwise-inactive socket connections to the Campaign listener.

Using the `keepalive` configuration parameter enables socket connections to remain open through extended periods of application inactivity in environments configured to close inactive connections between the web application and the listener (for example, a firewall).

When there is activity on a socket, the keep alive period is automatically reset. At the DEBUG logging level in the web application server, the `campaignweb.log` will show evidence of the keep alive messages as they are sent to the listener.

Default value

0, which disables the keepalive feature

Valid Values

positive integers

**Campaign | server**

The property in this category specifies a URL that is used internally, and does not need to be changed.

**fullContextPath**

Description

The `fullContextPath` property is used internally, and specifying a value is optional. It specifies the URL that the ActiveX control uses to communicate to the application server Listener proxy.

This property is undefined by default, which causes the system to determine the URL dynamically.

Default value

No default value defined.
**Campaign | logging**

The property in this category specifies the location of the Campaign log properties file.

**log4jConfig**

**Description**

The log4jConfig property specifies the location of the Campaign log properties file, campaign_log4j.properties. Specify the path relative to the Campaign home directory, including the file name. Use forward slashes (/) for UNIX and backslashes (\) for Windows.

**Default value**

./conf/campaign_log4j.properties
Appendix B. Special characters in Campaign object names

Names of objects in Campaign can have specific requirements. Some special characters are not supported in any Campaign object names. In addition, some objects have specific naming restrictions.

**Note:** If you pass object names to your database (for example, if you use a user variable that contains a flowchart name), you must ensure that the object name contains only characters supported by your particular database. Otherwise, you will receive a database error.

### Special characters not supported

Do not use any of the characters listed in the following table in the names of these objects:
- campaigns
- flowcharts
- folders
- offers
- offer lists
- segments
- sessions

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%</td>
<td>Percent</td>
</tr>
<tr>
<td>*</td>
<td>Asterisk</td>
</tr>
<tr>
<td>?</td>
<td>Question mark</td>
</tr>
<tr>
<td>!</td>
<td>Pipe (vertical bar)</td>
</tr>
<tr>
<td>:</td>
<td>Colon</td>
</tr>
<tr>
<td>,</td>
<td>Comma</td>
</tr>
<tr>
<td>&lt;</td>
<td>Less than symbol</td>
</tr>
<tr>
<td>&gt;</td>
<td>Greater than symbol</td>
</tr>
<tr>
<td>&amp;</td>
<td>Ampersand</td>
</tr>
<tr>
<td>\</td>
<td>Backward slash</td>
</tr>
<tr>
<td>/</td>
<td>Forward slash</td>
</tr>
<tr>
<td>“</td>
<td>Double quotation mark</td>
</tr>
</tbody>
</table>

### Objects with no naming restrictions

The following objects in Campaign have no restrictions for characters used in their names:
- audience levels (audience level field names have naming restrictions)
• custom attribute display names (custom attribute internal names have naming restrictions)
• offer templates

Objects with specific naming restrictions

The following objects in Campaign have specific restrictions on their names:
• custom attribute internal names (custom attribute display names have no naming restrictions).
• audience level field names (audience level names have no naming restrictions)
• cells
• derived fields
• user table and field names

For these objects, names must:
• contain only alphabetic or numeric characters, or the underscore (_) character
• start with an alphabetic character

Note: Derived field names have additional restrictions. For details, see “Naming restrictions for derived fields.”

Naming restrictions for derived fields

Derived field names have the following restrictions:
• They cannot be the same as either of the following types of names:
  − A database keyword (such as INSERT, UPDATE, DELETE, or WHERE)
  − A field in a mapped database table
• They cannot use the words Yes or No.

If you do not follow these naming restrictions, database errors and disconnects may result when these derived fields are called.

Note: Derived field names also have specific character restrictions. For details, see Appendix B, “Special characters in Campaign object names,” on page 317
Appendix C. Supported data types for user tables

This topic lists the data types that Campaign supports for user tables created in each supported database. Any other data types not listed here are unsupported. Before mapping user tables in Campaign, ensure that your tables use only supported data types.

**DB2**

- bigint
- char
- date
- decimal
- double
- float
- int
- numeric
- real
- smallint
- timestamp
- varchar

**Netezza**

- bigint
- byteint
- char(n) [1]
- date
- float(p)
- int
- nchar(n) [2]
- numeric(p, s)
- nvarchar(n) [2]
1. Not supported when used in the same table with nchar or nvarchar.
2. Not supported when used in the same table with char or varchar.

**Oracle**

DATE

FLOAT (p)

NUMBER [ (p, s) ] [1]

TIMESTAMP

VARCHAR2(size BYTE)

1. Precision is required when using NUMBER unless you have set the data source property Campaign > partitions > partitionN > dataSources > [dataSourceName] > UseSQLToRetrieveSchema to TRUE. If you do not specify a precision and do not set that data source property, Campaign assumes it can store the values in a data type that preserves 15 digits of precision. This can be problematic because, if the field holds values whose precision exceeds 15 digits, precision will be lost when the value is brought into Campaign.

**SQL Server**

bigint

bit

char(n) [1]

datetime

decimal

float

int

nchar [2]

numeric

nvarchar [2]

real

smallint

text
tinyint

varchar(n) [1]
1. Not supported when used in the same table with nchar or nvarchar.
2. Not supported when used in the same table with char or varchar.

**Teradata**

bigint
byteint
char
date
decimal
float
int
numeric
smallint
timestamp
varchar
Appendix D. Internationalization and encodings

This section provides information on character encodings and language-sensitive database considerations, and lists the encodings supported by Campaign and PredictiveInsight.

Character encodings in Campaign

On most operating systems, Campaign uses the GNU iconv library. Note that **Unica does not ship an iconv for AIX installations.** For an AIX system, you must obtain the appropriate character sets. For a list, see the National Language Support Guide and Reference:

This section lists the encodings that are supported by Campaign. The values in these lists are valid values for setting the Campaign internationalization parameters listed in “Set Campaign language and locale property values” on page 173. Note the following:

- Each bullet within an encoding group is a space-separated list of different names for the same encoding. Each name in a bullet with multiple names is an alias for the other encodings in the group. You can set the Campaign configuration parameters to any of the values in a group, depending on how your system uses the encodings.
- When setting values for the Campaign StringEncoding configuration parameters, the pseudo-encoding WIDEUTF-8 is the recommended value in most cases. However, you can use one of the encodings included in the following lists.
- Additionally, if the database is DB2 or SQL Server, you should use a code page rather than one of the encodings in this list. For details, see the context help or the Marketing Platform Administrator’s Guide.
- Campaign uses two character encodings that are treated slightly differently than other encodings: “ASCII” and “UTF-8.” Both are case-sensitive. These encodings are accepted on all platforms including AIX. They have slightly different behaviors in Campaign for column widths during table mapping, and for transcoding operations.

Date and time formats

Use the information in the following sections to determine how to configure the date and time format configuration properties DateFormat,

DateOutputFormatString, DateTimeFormat, and DateTimeOutputFormatString.
**Formats for DateFormat and DateTimeFormat**

If you are not configuring Campaign for multiple locales, you can set the values for `DateFormat` and `DateTimeFormat` configuration parameters for any of the formats specified in the `DATE` macro, as shown in the following table.

However, if you need to configure Campaign for multiple locales (if you have users with various languages and locales), **DO NOT** use date formats that contain 3-letter months (MMM), `%b (abbreviated month name), or %B (full month name). Instead, use a delimited or fixed format that has a numeric value for the month. For more details about the multi-locale feature, see “About the multi-locale feature” on page 170.

*Table 74. Date formats*

<table>

</tr>
</tbody>
</table>

**Formats for DateOutputFormatString and DateTimeOutputFormatString**

If you are not configuring Campaign for multiple locales, you can set the values for DateOutputFormat and DateTimeOutputFormat configuration parameters for any of the formats specified for format_str in the DATE_FORMAT macro, as shown in the following table.

However, if you need to configure Campaign for multiple locales (that is, if you have users with various languages and locales), DO NOT use date formats that contain 3-letter months (MMM), %b (abbreviated month name), or %B (full month name). Instead, you should use one of the delimited or fixed formats that have a numeric value for the month. For more details about the multi-locale feature, see “About the multi-locale feature” on page 170.

- `%a` - Abbreviated weekday name
- `%A` - Full weekday name
- `%b` - Abbreviated month name
- `%B` - Full month name
- `%c` - Date and time representation appropriate for locale
- `%d` - Day of month (01 - 31)
- `%H` - Hour in 24-hour format (00 - 23)
- `%I` - Hour in 12-hour format (01 - 12)
- `%j` - Day of year (001 - 366)
- `%m` - Month number (01 - 12)
- `%M` - Minute (00 - 59)
- `%p` - Current locale’s AM/PM indicator for 12-hour clock
- `%S` - Second (00 - 59)
%U - Week of year, with Sunday as first day of week (00 - 51)
%w - Weekday (0 - 6; Sunday is 0)
%W - Week of year, with Monday as first day of week (00 - 51)
%x - Date representation for current locale
%X - Time representation for current locale
%y - 2-digit year (00 - 99)
%Y - 4-digit year
%z, %Z - Time zone name or abbreviation; no output if time zone is unknown
%% - Percent sign

Note: Characters that are part of the format and are not preceded by a percent sign (%) are copied unchanged to the output string. The formatted string must fit in 16 bytes or less. Use the # character to eliminate any leading 0. For example, %d produces 2-digit numbers in the range (01 - 31), while %#d produces 1- or 2-digit numbers as appropriate (1 - 31). Similarly, %m gives (01 - 12) while %#m gives (1 - 12).
Appendix E. Campaign error codes

Campaign is a Web-based client-server application with two servers and a number of environment variables that you must configure for it to work properly.

Campaign notifies users of error events when they occur with error messages that consist of a code number and error text.

If you see an error message that says you have invalid user access rights, you may not have the correct privileges assigned in Marketing Platform to perform that action. For more information, see the Marketing Platform Administrator’s Guide.

If you encounter errors while using Campaign, try reading the descriptions and applying the solutions in this section before contacting Unica Technical Support. If an error does not appear here, or if a solution fails, contact your administrator or contact Unica Technical Support.

Campaign error codes

The following table lists the error messages generated by Campaign.

<table>
<thead>
<tr>
<th>Code</th>
<th>Error Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>301</td>
<td>Unable to allocate requested memory.</td>
</tr>
<tr>
<td>303</td>
