Chapter 1. An Introduction to Unica Journey

Unica Journey is a goal-based orchestration solution to craft, execute, and visualize context-driven, personalized, multi-step omnichannel customer experiences.

Marketers can use Unica Journey to:

- Define goals for customer experience
- · Easily adjust journeys in real time to achieve them
- Craft and visualize entire customer journey across channels/touchpoints and events with a sleek and intuitive
 Journey Canvas

Customer journeys are completely automated and synchronized with every step of your customer's brand engagement. Use the real-time Insights within Journey to understand customer behavior with insights that reflect things as they happen in their Journey.

Features of Unica Journey

The features of Unica Journey are as follows:

- Goal driven Experiences: Define goals for your customer experience and easily adjust your journeys in real time to achieve them.
- Orchestration Canvas: Craft and visualize your entire customer journey across channels/touchpoints and events with a sleek and intuitive Journey Canvas.
- Always on Engagement: Completely automated execution that is in sync with every step of your customer's brand engagement.
- **Real-time Insights**: Understand your customer behavior with insights that reflect things as they happen in their Journeys.
- Choice of Touchpoints: Leverage the out of the box native touchpoints for digital channels or craft a custom touchpoint and seamlessly orchestrate the journey across your eco system.
- **Dynamic Data Framework**: Flexible data definition and entry sources to augment customer journey with contextual data and events from multiple touchpoints and in variety of formats (File, API, etc.)

Benefits of Unica Journey

The benefits of Unica Journey are as follows:

- Increased Brand Loyalty: Strengthen your brand following with targeted and automated journeys that acquire, nurture, convert and retain customers.
- Amplified Omni Channel Engagement: Deliver a consistent customer experience across channels with native integration for outbound (Unica Campaign) and inbound engagement (Unica Interact, Unica Discover, and Unica Deliver).
- Shorten your Customer Conversion Cycle: Be a step ahead and drive your customer to their goals with timely next best actions.
- **React to the Moment**: You will not miss any opportunity to know where your customer is on their journey and delight them with relevant experience.
- Lower Marketing TCO: Reduce your marketing TCO with automated flows and plug and play integration to your MarTech ecosystem through an open and flexible framework powered by the Unica Link.

Chapter 2. New navigation UI

Unica has introduced New UI.

- 1. Administrators will have access to switch it for any individual user through User settings > Edit preferences.
- 2. Toggle button present at the top of the screen will help user to switch between Classic UI (Old UI) and Neo UI (New UI).

NPN

Unica Platform provides a common access point and user interface for Journey. The common interface provides the following features.

- When multiple Unica products are installed, you can navigate between products without launching new windows.
- You can view a listing of the pages that you have recently visited, and navigate back to any of those pages using the **Recent** menu.
- You can set a page as favorite by clicking on Favorites icon and page will be listed in Favorites list.
- You can access the search function for Folders, Journeys, Entry sources, Data definitions, Template, All folders using the Search field. For example, if you are viewing a list of entry sources within Journey, a search would take place across entry sources.

Chapter 3. Journey Multi Partition

From V12.1.7 onward, Journey will support multi partition. For users upgrading to 12.1.7, if there is more than one partition in their system then it might lead to cross-partition references amongst the various entities in the Journey application.

Example of cross-partition reference:

Entry source ES001 created by a user of partition1, is being used in a Journey JS0001 created by user of partition2.

An administrator should run following query before the upgrade.

select * from organisations

If this query returns only one record and with id column value as 1, then such system can be upgraded directly to 12.1.7. Otherwise, user will have to get in touch with support team to check and fix cross-partition references present in the system (if any)

Prior to 12.1.7, a user could access entities belonged to other partition.

• From 12.1.7 onward, user's view will be restricted to the entities of his own partition. e.g. user of partition1 can see only those entry sources, data definitions, templates, Journeys and folders which belong to their partition.

Accessing entities of other partition in any way will result in an error 404 (not found). This is to ensure that any malliecious user does not invoke Journey's rest APIs to access cross-partition resources.

- A Journey will not accept the data coming via an entry source which belong to different partition. In such case system will log an error. However, if a given entry source is used in multiple Journeys and some of those belong to the partition of the entry source, then the data will be sent to only those Journeys.
- A Journey will not be able to publish the data to an entry source which belong to different partition via publish action touchpoint. In such case, system will log an error and the audience will move to next touchpoint.
- If a client id /secret pair is used to input the audience data through /api/entry sources/rest/data, then such pair should belong to the partition of an entry source. Otherwise, system will give an error 404 not found. In such case, the administrator will have to generate a new client id/secret pair by logging as the user of an entry source's partition. All the references of existing client id/secret pair in the downstream applications will have to be corrected as well.
- A user cannot copy a Journey with references of entry source or data definition of other partition. Else, system will give 404 not found error to the user.

Configuration changes in platform configuration.

On clean installation of 12.1.7 or upgrade to 12.1.7, a new node *partitions* will be added in the Journey application's node. Administrator will have to create one or more partitions by clicking on partition template node and specifying the partition name. The number of partitions and their names must match with those present in other installed unica products like campaign, deliver etc. On adding partition Node, for example partition1, following attributes will appear when user clicks on partition node (e.g. Affinium|Journey|partitions|partition1)

- Link_Configured (default No)
- Deliver_Configured (default No)
- Contact_Central_Configured (default No)
- Dedup_End_Audience (default No)
- Goal_Max_Allowed (default 15)
- Mask_Exported_Audience_Data (default No) This property is specific to engine. If the property is set to Yes, then
 maskable fields in audience details will be masked while publishing the audience details to csv or kafka topic in
 publish action touchpoint. If the Full_Mask_Exported_Audience_Data property is set to Yes, then maskable fields in
 audience details will be fully masked.
- Full_Mask_Exported_Audience_Data (default No) This property is applicable for both web and engine. In case of journey web, if the audience details pop-up is visible and clickable in the first place on journey canvas, then the values of maskable fields will be completed masked if this property is set to **Yes** and will be partially masked if the property is set to **No**.

In case of journey engine, when the audience data is published to csv file or kafka topic on publish action touchpoint and if both the properties Full_Mask_Exported_Audience_Data and Mask_Exported_Audience_Data is set to **Yes**, then the values of maskable fields in that data will be completed masked and will be partially masked if the property is set to **No**.

Following Nodes will be added in each of the partition node

Journey Configurations

- Journey_Waittime_Configurations
- Sync_Contact_and_Response_Tables
- Validations_On_Journey_Records
- Validation_Headers Enable/Disable Audience Details Pop-up depending on the headers and its value configured in Journey Configurations under: Affinium|Journey|partition|partition|Journey_Configurations|Validation_Headers

If all the mentioned headers found in the http request and each header contains at least one of the supported values mentioned in the configuration, then Audience details pop-up will be shown to the user. Header names and values are not case sensitive i.e. they will match without considering their case (upper/lower). In each of the triplets which consists of header name, supported value(s) and field separator (in case of multiple values), administrator can choose the field separator of their choice. If the value separator field is kept blank, then entire value will be considered as a single supported value.

- Validation_Header_Template
- Link Configuration
- Deliver Configuration
- Integration

Note: The settings in application.properties as well as global settings in platform configurations (i.e. settings outside the partitions) have been retained for customer's reference.

Journey_Waittime_Configurations

- Engagement_Split_Waittime Default wait time for engagement split in minutes
- · Decision_Split_Waittime Default wait time for decision split in minutes
- Max_No_Of_Days_In_Delay_Evaluation Default value for max days allowed in delay.
- Max_No_Of_Days_In_Delay_Expression Default value for max days allowed in data definition based delay expression.

Sync_Contact_and_Response_Tables

• Sync_Contact_and_Response_Tables - This configuration decides whether to sync CHRH in case of Offer integration or not. If this flag is set to true then only CHRH will ETL to Campaign tables in case of Offer integration. If the flag is set to false, then user can stop posting on to the CH RH topic.

Supported Values: True/False

Default Value: True

Validations_On_Journey_Records

• Validations_On_Journey_Records - [Default value is Yes]

Link Configuration

- Link_URL [change_me]
- Link_Data_Source_User [change_me]
- Link_Data_Source_Name [change_me]
- · LinkProjectName _app_journey [Default Should be kept as is for all partitions]
- · Application journey[Default Should be kept as is for all partitions]

Note: From 12.1.8 release Journey supports multi-partition Link support. User can configure same Link instance in multiple Journey partitions.

In each Journey Partition node user needs to configure Link information as below:

1. Navigate to Journey <Partition1> node location -> (Affinium|Journey|partitions|<partition1>| Link_Configurations) and below parameters

Link_URL: https://Linkhostname.com

Link_Data_Source_User: <partition1_user>

Link_Data_Source_Name: <LinkDS>

LinkProjectName: _app_journey [Default - Should be kept as is for all partitions]

Application: journey [Default - Should be kept as is for all partitions]

Now navigate to Settings > Users > <Partition1_user> > Edit data sources.

add <LinkDS> Datasource for Partition1 user

2. Navigate to Journey <Partition2> node location -> (Affinium|Journey|partitions|partition2| Link_Configurations) and below parameters

Link_URL:https://Linkhostname.com

Link_Data_Source_User: <partition2_user>

Link_Data_Source_Name: <LinkDS1>

LinkProjectName: _app_journey [Default - Should be kept as is for all partitions]

Application: journey [Default - Should be kept as is for all partitions]

Now navigate to Settings > Users > <Partition2_user> > Edit data sources.

add <LinkDS1> Datasource for Partition2 user

Deliver Configuration

• Deliver_URL - User needs to configure valid Deliver TMS URL [change_me]

Note: The configuration Affinium|Journey|Deliver_Configurations|Unsubscription_Attribute is still global i.e. it is not present at partition level.

The purpose of this node is to handle an un-subscription Event coming from end user who will click on the Unsubscribe landing page provided in any Email Template (created in Deliver). The key-Value pair created under this node in Platform become a mandate requirement to have them as a hidden attribute with same value for the Unsubscribe Landing pages, which needs to be used by Journey for handle the Unsubscription at Journey Level for the deliver template used in Journey.

Integration

preferredCognitiveServiceProvider

Note:

From V12.1.7, Journey Engine will also read the partition configuration from platform on startup. Any changes in the configuration inside partition node will require restart of Journey Web and Journey Engine.

Upgrading Journey to 12.1.7 requires platform to be upgraded to 12.1.7.

Chapter 4. Clean-up Journey Audiences

From V12.1.7 onwards, journey audiences can be removed from live running journeys. There will be a cron job scheduled (customer can configure cron expression on need basis), which will find all audiences with status JOURNEY_COMPLETED and JOURNEY_ENDED and remove those, as well as their related data (like audience responses, milestone, goals, etc data) from respective tables. This removed data will not be recoverable. This will help in improving overall performance of journey engine. To support this, we introduced below properties in engine's application.properties file.

1. cleanup.audience.enable=true/false - Journey data clean-up is enabled/disabled respectively.

Note: This setting is used for deleting audiences of deleted journey and its associated data from Journey system database tables.

If cleanup.audience.enable=true, then below are the side effects on Journey audience counts:

a. Journey Stats count

If journey that had audiences older than (archival.audience.ttl=x) days ago - the data for these audiences will be deleted and hence the count on journey start node will be decreased accordingly.

As audience records are deleted, their respective responses (if any) will also get deleted, hence responses (visible on stats) available on touchpoints (Email, SMS, Push, WhatsApp, REST, JDBC, Loop, Salesforce) will also get decreased accordingly.

Note:

- Publish touchpoint statistics for audiences will remain the same and is not impacted by above deletion.
- Adtech touchpoint statistics for audiences will remain the same and is not impacted by above deletion.
- Journey Audience Flow counts across journey canvas branches will not be affected.
- Audiences that came in journey in less than (archival.audience.ttl=x) days will not be affected and will remain as-is on journey statistics and start node.

b. Journey Goals and Goal Analysis

- Journey that had goals achieved by audiences which are older than (archival.audience.ttl=x) days the goal achieved count will get decreased accordingly after deletion.
- For frequency and non-frequency based goals As audience response are deleted, achieved target will also get decreased accordingly. Hence, the set target will have to be achieved again.
- For non frequency based goals If there is journey goal complete criteria marked for aspecific goal, the journey will be completed after achieving the set target.
- On Journey Goal Analysis Page The graphs for all goals will be displayed as per the new goal achieved count after deletion of journey audiences.

c. Journey Audience Analysis Tab

If journey that had audiences older than (archival.audience.ttl=x) days ago, the data for these
audiences will be deleted and hence the count on journey audience analysis tab will be decreased, and
graphs will be represented accordingly.

d. Milestones on journey canvas page

After deletion of audiences, milestones count on journey canvas page will get refreshed only when new audiences comes in Journey milestone and then only user can see reduced count on milestone canvas page.

e. Milestone Analysis Tab

If journey that had audiences older than (archival.audience.ttl=x) days ago - Count for milestoneanalysis page will get reduces same as Mileston canvas page. Hence, Milestone Achieved By (%) will be affected.

f. Journey Performance Tab

After deletion of audiences, counts on performance tab for Email, SMS and Push Tiles will not have any impact and will remain as-is.

g. Loop

If journey that had audiences older than (archival.audience.ttl=x) days ago - Response counts shown on loop details link will also be affected accordingly.

- 2. archival.audience.enable=true/false Journey audiences archival from **journeyaudiences** to **endjourneyaudience** table is enabled/disabled respectively.
- 3. archival.audience.ttl=X If cleanup.audience.enable=true, Journey audiences older than X-days in Journey, then the Journey audiences and their associated data will get deleted at set frequency **archival.audience.cron**, Journey audiences and their associated data less than X-days older in Journey will remain available in Journey.

Note: Default value of **archival.audience.ttl** is 365 days. User can set minimum 2 days, if user adds any value less than 2 days, then its equivalent to 2 days for this property.

 archival.audience.cron=0 0/5 * * * ? -> Journey audience clean up will be executed according to set frequency of this cron job.

Example:

cleanup.audience.enable=true

archival.audience.enable=true

archival.audience.ttl=3

archival.audience.cron=0 0/5 * * * ?

In above case, as archival.audience.enable=true, audiences with status Journey_completed/Journey_ended will be moved from **journeyaudiences** table to **endjourneyaudience** table and as user set cleanup.audience.enable=true and archival.audience.ttl=3, Journey audiences with Journey_completed or Journey_ended and older than set 3-days will get cleaned up along with their data available in the database tables at set frequency "archival.audience.cron=0 0/5 * * ?"

5. ssl.restclient.http.header.attributes - When the property is set in the engine application.properties file the pipe (|) separated values are always added to the headers. When in the REST process box additional headers are define, just append them.

If engine's application.properties contain a key say ssl.restclient.http.header.attributes=<list of key value pairs>, then these headers will implicit during the runtime while making rest call.

Note: These headers are not displayed on UI. If any of such header is also configured on UI, then its value defined on UI will take priority over the one defined in application.properties.

If journey engine is deployed in cluster mode:

- 1. To run both archival and cleanup process on one node, make both flags true on that one node.
- 2. To disable both archival and cleanup processes, make them false on all nodes.
- 3. To run archival and cleanup processes on different engine nodes, make these properties individually true on any two engine server nodes.

Example: Let's consider, in cluster we have four engine nodes, if user want to run clean-up process on two different engine node then user needs to do the below settings:

cleanup.audience.enable=true server 1

archival.audience.enable=false server 1

cleanup.audience.enable=false server 2

archival.audience.enable=true server 2

cleanup.audience.enable=false server 3

archival.audience.enable=false server 3

cleanup.audience.enable=false server 4

archival.audience.enable=false server 4

Note:

While deleting millions of Journey audiences and their related data, QueryTimeOut exception may occur. To avoid this, we are recommending to create below indexes immediately after installing or upgrading Journey to 12.1.7 or before starting Journey engine:

- create index MY_UJR_IDX_LAF on LoopAudienceFlow(audienceId);
- create index MY_UJR_IDX_BIDADM on BatchIDAudiencedataMap(audienceld);
- · create index MY_UJR_IDX_JAG on JourneyAudienceGoal(audienceId);
- · create index MY_UJR_IDX_ARHD on AudienceResponseHTTPDetail(audienceResponseId);
- create index MY_UJR_IDX_ARE on AudienceResponseExtended(audienceResponseId);
- create index MY_UJR_IDX_ARMD on AudienceResponseMetaData(audienceResponseId);
- create index MY_UJR_IDX_ARI on AudienceResponseInteraction(audienceResponseId);
- create index MY_UJR_IDX_AR on AudienceResponse(audienceId);
- create index MY_UJR_IDX_JAF on JourneyAudienceFlow(audienceId);
- create index MY_UJR_IDX_AWS on AudienceWaitState(audienceId);
- · create index MY_UJR_IDX_JDRM on JourneyDeliverResponseMaster(audienceId);
- · create index MY_UJR_IDX_JAM on JourneyAudienceMilestone(audienceId);

Chapter 5. Unica Journey integrations

Unica Journey execution engines for email

Unica Journey supports Unica Deliver and Unica Link for email delivery. You can use either for integration with Journey.

Unica Journey integration with Unica Link

Unica Link provides capabilities to send communications across email, SMS, CRM, ADTECH and JDBC channels. Unica Link provides the following reference connectors to deliver communications to email, SMS, CRM, ADTECH and JDBC channels.

Install the following reference connectors as per your preference:

- MailChimp for email
- Mandrill for email
- Twilio for SMS
- Salesforce for CRM

Integration with Unica Link allows Journey to integrate with any third-party vendors for email, SMS, CRM, ADTECH and JDBC executions only.

Table 1. Installation and Configuration of Unica Link

Task	Documentation
Installation and configuration of Unica Link	See Unica Link V12.1 Installation Guide.
Installing Unica Link connector app for Journey	See Unica Link V12.1 Installation Guide.
Installing Unica Link connector – MailChimp	See Unica Link Mailchimp Connector User Guide.
Installing Unica Link connector – Mandrill	See Unica Link Mandrill Connector User Guide.
Installing Unica Link connector – Twilio	See Unica Link Twilio Connector User Guide.
Installing Unica Link connector – Salesforce	See Unica Link Salesforce Connector User Guide.

Note: HCL does not provide the account or access to these delivery channel vendors. Based on your preference you can get the entitlements or accounts from these vendors.

Unica Journey integration with Unica Deliver

Unica Journey utilizes the capabilities of Unica Deliver for sending email communications. This also helps in capturing the email responses in real-time and process audience Journey. For more details on enabling Unica Deliver integration with Unica Journey, see *Unica Journey Installation Guide*.

Unica Journey integration with Unica Campaign and Unica Interact

Unica Journey seamlessly integrates with Unica Campaign and Unica Interact. Unica Campaign and Unica Interact sends audience data to Unica Journey on a specific Kafka topic. The audience data is sent through a Kafka entry source and pushed across all journeys consuming data from these entry sources.

For more information on Unica Campaign and Unica Interact integration with Unica Journey, see the guides mentioned in the following documentation map.

Journey supports data from multiple partitions of Campaign

Journey support data from multiple partitions of campaign.

- 1. Journey application does not support multiple partitions.
- 2. Only data from multiple partitions of Campaign/Interact/Deliver can be processed in Journeys. For this journey, will run on single partition.

You need to make changes in configuration platform and user roles and permission:

- Campaign flowchart details displayed under the entry sources come from multiple partitions.
- Based on the partition the Deliver templates are displayed in email / SMS / WhatsApp touchpoints.

Table 2. Integration of Unica Campaign with other HCL products

Task	Documentation
Integration of Unica Campaign and Unica Journey	See Unica Campaign Administration Guide and Unica Campaign User Guide.
Integration of Unica Campaign and Unica Interact	See Unica Interact Administration Guide.

Unica Journey integration with Unica Discover

Unica Journey seamlessly integrates with Unica Discover. Unica Discover sends audience struggle data to Unica Journey. The audience data is sent through REST entry source and pushed across all journeys consuming data from these entry sources. Four scripts will be provided, after installing Journey you need to immediately run the scripts, this will create two entry sources and two data definition called Discover Entry source for CART and Discover Entry source for Form. The scripts are:

- Discover-MariaDB.sql
- Discover-MS-SQL.sql
- Discover-OneDB.sql
- Discover-Oracle.sql

DD Name	Cart
	When Customer abandons any kind of cart or set of selected offerings this event can be triggered.

Table 3. Attributes to be sent across

Name	Туре	Length	Note
Email*	TEXT	200	It is a mandatory field.
Name	TEXT	200	
DiscoverSessionId	TEXT	50	Discover Session id required to link it back.
CartId	TEXT	50	Unique id to identify cart.
CartValue	NUMBER		
EventDateTime	TIMESTAMP		Date and time of the event in UTC Longitude
EventType	ТЕХТ		Event Type can be CART_ABANDONED
CookielD	TEXT	1024	
TLT_BROWSER	TEXT	50	Browser details

HTTP_ACCEPT_LANGUAGE	ТЕХТ	50	Language
EventType	ТЕХТ		Event Type can be FORM_SUBMITTED, FORM_ABANDONED

Table 4. Attributes to be sent across (continued)

Note: From Fixpack 3 onwards Unica Journey integration with Unica Discover feature is available.

An Introduction to Unica Deliver

Unica Deliver is a web-based, enterprise scale marketing message solution that you can use to conduct outbound bulk messaging and transactional messaging campaigns. Deliver integrates with Unica Campaign and with secure message composition, transmission, and tracking resources that are hosted by Unica.

You can use Deliver to create, send, and track personalized email communication. As Deliver installs and operates with Campaign, you can use Campaign flowcharts to precisely select and segment recipient information to customize each message.

Select your audience

Use Campaign to select message recipients and data about each person that you can use to personalize each message.

With Deliver, you can reach large numbers of email recipients quickly and personally. However, you can also configure a mailing to automatically send a single email message in response to a transaction.

Create a message

The Deliver Document Composer provides editing tools that you can use to design, preview, and publish personalized message content. You can create messages with content that you upload to the Document Composer or link to external content when Deliver builds and transmits messages. Deliver provides several ways to design messages that display content conditionally, based on personal data for each recipient.

Send the message and track responses

Depending on your goals, you can schedule a messaging campaign to run as soon as possible or schedule it to run later. Deliver monitors message delivery and tracks recipient responses. The system returns contact and response data to the Deliver system tables that are installed as part of the Campaign database schema.

How to get started

To get started, you must install Campaign and have a hosted messaging account.

System administrators must request a hosted messaging account and work with Unica to configure secure access to the remote messaging and tracking systems. Some messaging features are available only upon request to Unica. For more information about establishing a hosted messaging account and configuring access to Unica hosted messaging, see the *Unica Deliver Startup and Administrator's Guide*.

Unica Deliver integration

To integrate Unica Deliver with Unica Journey, you must make the following configurations inUnica Platform.

1. In Unica Platform, navigate to Settings > Configuration.

Result

The Configuration categories page appears.

2. Select Journey.

Result

The Settings for 'Journey' page appears.

3. Select Edit settings.

Result

The (Journey) page appears.

- 4. Perform the following steps:
 - a. For the Deliver_Configured field, select Yes.
 - b. Click Save changes.

5. In the expanded Journey node, select Deliver_Configurations.

Result

The Settings for 'Deliver_Configurations' page appears.

6. Select Edit settings.

Result

The (Deliver_Configurations) page appears.

- 7. Perform the following steps:
 - a. Provide values for the following fields:
 - Deliver_URL: The URL cofigured for Deliver.

Note:

- i. User needs to update the TMS URL in Journey configuration. Update the TMS url as SOAP TMS url is not supported, only REST url is supported. Navigate to Platform > Settings > Configuration > Journey > Deliver_URL.
- ii. From V12.1.6 onwards, users need to update old **Deliver API URL** with new **Deliver** REST API URL. After upgrade, ensure to republish all Journeys with deliver touchpoint.

Location: (Affinium | Journey | Deliver_Configurations)

New Deliver URL e.g. http://<host-name>/delivertms/api/deliver/rest/v2/tms

- Deliver_Partition: The partition in which the credentials to access the Deliver_URL is stored.
- If Journey having any deliver touchpoint configured, User needs to pause and republish the Journey, then only audiences start processing
- b. Click Save changes.

Kafka integration

You must configure Kafka in Unica Platform for the Journey node.

Accessing Kafka_Configurations in Unica Platform

To access Kafka_Configurations, complete the following steps:

- 1. On Unica Platform, navigate to **Settings > Configuration**.
- 2. Expand the Journey node.
- 3. Select Kafka_Configurations.
- 4. Select Edit settings.

Mandatory configurations based on CommunicationMechanism value

In the (Kafka_Configurations) page, you can select one of the following values for the CommunicationMechanism field:

- NO_SASLPLAINTEXT_SSL
- SASL_PLAINTEXT
- SSL
- SASL_PLAINTEXT_SSL

Based on your selection, the following fields become mandatory:

Field name	NO_SASLPLAIN	SASL_PLAIN	SSL	SASL_PLAIN
	TEXT_SSL	ТЕХТ		TEXT_SSL
KafkaBrokerURL	Yes	Yes	Yes	Yes
TopicName	Yes	Yes	Yes	Yes
sasl.mechanism		Yes		Yes
UserForKafkaData		Yes	Yes	Yes
sasl.jaas.config.data		Yes		Yes

Field name	NO_SASLPLAIN	SASL_PLAIN	SSL	SASL_PLAIN
	TEXT_SSL	ТЕХТ		TEXT_SSL
Source				
truststore.location			Yes	Yes
truststore.password.data			Yes	Yes
Source				
keystore.location			Yes	Yes
keystore.password.data			Yes	Yes
Source				
key.password.dataSource			Optional	Optional
ssl.endpoint.identification.			Yes	Yes
algorithm				

Make the necessary configurations and click **Save changes**.

Note: Running out of disk storage and abruptly shut down the kafka server due to the large size of kafka logs file.

Note: Once an audience type is used for configuration, then it cannot be used again for other configurations. While configuring CIF if one audience type is used, then same audience type cannot be used again in the same entry source.

Kafka Topics

Below Kafka topics get created when Journey engine starts.

Kafka Topics	Description
DATA_CLEAN	Used by Data Clean-up Service to apply the clen-up rules for the filtering of the incoming data.
JOURNEY_EVENT	Used by Orchestration Service to orchestrate the Journey Canvas flow.
Kafkalog	Used for async logging.

Kafka Topics	Description
JOURNEY_PARSER	Used by Journey parser Service to parse the Journey Canvas design.
DATA_FETCH	Not being used after 12.1.3
DELAYV2	Consumed by Delay Service to apply delay on the published audience.
END	Used by Journey when the audience's journey ends.
ASYNC_DATABASE_STREAM_DATALOG	
ASYNC_DATABASE_AUDIENCE_RESPONSE	Used by Engine to insert the audience response data to audienceresponse table.
ASYNC_DATABASE_DISCARD_DATA	Used by journey to process discarded audience data.
ASYNC_DATABASE_AUDIENCE_FLOW	Used by Engine to insert stats records in journeyAudienceFlow Table.
ASYNC_DATABASE_DATA_ERRORS	Used by Journey for processing errors.
ASYNC_DATABASE_AUDIENCE_BULK_REPONSE	Used by Engine to insert the audience response data to audience bulk response table for Adtech.
ASYNC_DATABASE_UNSUBSCRIBE_EMAIL	Used by Engine to insert the registration of subscription of email from Journey.
SMS_SEND	Used by SMS Service to send the SMS via configured channel to the published audience.
SALESFORCE_SEND	Used for sending the data to salesforce via Link.
JOIN	This topic is used by engine, to simply pass on the audiences from one node(predecessor) to another node(successor) by connecting them through a join control.
LOOP	This topic is used by engine, to receive the audiences from any of loop start node's predecessor node. Repeats the audiences as per loop limit configuration.
ENGAGEMENT_SPLIT	Used by engagement split service to consume audiences.
JOURNEY_GOAL	Used by the Goal service to consume data.
INCOMING_RESPONSES	Published Responses by Link, consumed by Engine.
PUBLISH_ACTION_POINT	Used by engine publishactionpointservice to get details of jouney , nodes and Audiences

Kafka Topics	Description
DELIVER_RESPONSES	published Responses by Deliver RCT module, consumed by Engine.
ADTECH_SEND	Consumed by Adtech Service to process the audience for Adtech.
ADD_MILESTONE	
PROCESS_MILESTONE	
WHATSAPP_SEND	Used by WhatsApp Service to send the message via configured channel to the published audience.
JDBC_SEND	Used by Engine to take action of the published audience ids for JDBC touch point.
REST_INIT	NOT IN USE
REST_API	Used By engine RestAPIService after configuring rest touchpoint in journey.
CHRH	Not in use after 12.1.5
DELAY_UPDATE	Used by Engine to update the audience data which is in delay
CALLABLE	
NOTIFICATION	
RESTREQUEST	Used by journey to send the rest request.
RESTEXECUTE	Used by engine RestExecutionservice to call secure and non-secure 3rd party API.
RESTRESPONSE	Used by journey to consume the response received from the rest service.
RESTUPDATE	Used by journey to process the response received from the rest service & update the journey audience detail.
RESTAUDIENCERESPONSE	Used in engine RestAudienceResponseService to save Audience response/data.
CIFINTEGRATION	USED by journey to consume data sent by CIF from external system.
EMAILWAIT	Used in engines EmailCapacityWaitService In noncomunication hour if request is received it will be in EMAILWAIT (Refer 12.1.7 user Guide page 31)

Kafka Topics	Description
SMSWAIT	Used in enginesSmsCapacityWaitServiceIn noncomunication hour if request is received it will be in SMSWAIT (Refer 12.1.7 user Guide page 31)
WHATSAPPWAIT	Used in engines WhatsAppCapacityWaitService In noncomunication hour if request is received it will be in WHATSAPPWAIT (Refer 12.1.7 user Guide page 31)
NOTIFICATIONWAIT	Used in engines PushNotificationCapacityWaitService In noncomunication hour if request is received it will be in NOTIFICATIONWAIT (Refer 12.1.7 user Guide page 31)
DELIVER_READER	Used by Deliver Helper Service to send the notification via Deliver to the published audience.
DEDUP	Used by Journey to consume the deduped data.
ESEVENT	
RESPONSE_ACTION_EVENT	
PAUSE_AUDIENCE_CALC_COUNT	The topic is used by Journey web to request the journey engine to calculate the count of audiences to be paused for a given pause rule.
PAUSE_AUDIENCE_EXEC	The topic is used by Journey web to request journey engine to start the pause execution process for a given rule.
PAUSE_AUDIENCE_PROC	The topic is used internally between the two components of pause process. The data extraction service in pause process reads the audience info to be paused and sends this information in the form of batches to the writer service through this topic.
JOURNEY_CONTROL	
DELIVER_RESPONSES_STAGE	Used by Engine Service to initiate the CH/RH responses.

Note: When a kafka instance file is created at Web and engine and configured on Publish touchpoint. On Publish journey, when data is sent, it is observed that Kafka topic is not getting created.

Workaround - After adding kafka instance file, user needs to restart engine then it allows to create kafka topic and process data on kafka topic.

Multiple Kafka

From V12.1.9 onwards, Journey supports multiple kafka under Publish touchpoint.

How to Configure Multiple Kafka in Web and Engine

Using multiple Kafka support Journey allow to write on any other KAFKA apart from one used internally. Publish touchpoint will have ability to pick KAFKA instance and then add kafka topic name. User needs to create folder of partition name e.g. **partition1**, **partition2** under Web and Engine location.

<Journey_Web_Installation_Location>/conf/external_kafka/partitions/partition/partition1

<Journey_Engine_Installation_Location>/conf/external_kafka/partitions/partition/partition1

sample.producer.properties file for reference is available under Web and Engine locations. User needs to modify
sample.producer.properties as per requirement like file name or Kafka host name. User needs to place same file under
below location, user needs to make sure instance file name and its contents are same under web and Engine locations.
Partition wise instances will be available under instance drop down on Publish TP under Kafka section.

Location: <Journey_Web_Installation_Location>/conf/external_kafka/partitions/partition/ partition1

<Journey_Engine_Installation_Location>/conf/external_kafka/partitions/partition/partition1

When a Kafka instance file is created at Web and Engine configured on Publish touch point user needs to restart Engine else data will not be processed by External Kafka topic.

Once working Kafka instance file is created with any host name or instance name - user is not allow to modify working Kafka instance file name and its content. Instead of modifying existing instance and its contents user needs to create a new Kafka instance file and contents.

Note: Before using an external Kafka instance, ensure it is accessible from the machine where the Journey Engine is installed. This can be verified using a Java test program. User needs to create its own java program to test, If issues persist, contact Unica Support team for assistance and to get Java test program.

Kafka Replication to Partition

BATCH_IMPORT

All Entry Source that publishes batch data – via a flat file, either CSV, TSC etc, shall publish messages to this topic. Each message shall correspond to one single batch of records.

- Entry Source ID
- Journey ID
- Data

- $\circ\,$ Timestamp time stamp when the message was added to the topic
- Entry Source Type
- FQN

- entrySourceID:
- journeyID:
- entrySourceType: enum
- data: FQN of the file containing the data
- timestamp:

STREAMING_IMPORT

All Entry Source that publishes streaming data – via a series of individual records, shall publish messages to this topic. Each message shall correspond to one single record.

Message Attributes

- Entry Source ID (if available)
- Data (in JSON format)
- Metadata
 - Timestamp time stamp when the message was added to the topic
 - Entry Source Type
 - Other Metadata

Object Type

- entrySourceID: (this is optional)
- entrySourceType: enum
- data: (JSON of single record)
- timestamp:
- metaData: (JSON of other data)

DATA_MAP

This topic will have messages once the incoming data is cleaned and needs to be mapped to a Data Definition.

- Entry Source ID
- Journey ID
- Data

- \circ Timestamp time stamp when the message was entered in the topic
- Data, in JSON
- Number of records, if in batch

- entrySourceID:
- journeyID
- entrySourceType: enum
- timeStamp
- data: <JSON string>
- numRecords:

RAW_DATA_FETCH

This topic will have messages to fetch unmapped data, from the DATA ARCHIVE table.

Message Attributes

- Entry Source ID
- Timestamp time stamp when the message was entered in the topic
- State state of data that need to be fetched, RAW or CLEANED
- Number of records Number of records to be fetched. If not specified, then all records

Object Type

- entrySourceID:
- timeStamp
- state: enum
- numberRecords:

END_JOURNEY

This topic shall hold all messages for the various running Journeys for which some of the audiences have reached a logical end of the defined Journey.

JOURNEY_EVENTS

This topic shall hold all the messages for the various events during the lifetime of a running Journey instance.

- ID this shall be a combination of the Journey ID and an optional Node ID
- Data

- ${}_{\circ}$ State the state of the Journey
- Timestamp
- Metadata

- ID: journeyID
- state: enum:
- timeStamp
- data:

PUBLISHED

- ID Journey ID
- Data
 - State PUBLISHED
 - $\circ\,$ Timestamp time stamp when the message was entered in the topic
 - \circ Metadata FQN for JSON file having the complete Journey structure

Object Type

- ID: journeyID
- state: enum:PUBLISHED
- timeStamp
- data: JSON for Journey structure (this can be the serialized form of the JSON)

PAUSE

- ID Journey ID
- Data
- $\circ\,$ Timestamp time stamp when the message was entered in the topic
- State PAUSE

Object Type

- ID: journeyID
- state: enum:PAUSE
- timestamp
- data: <empty>

JOURNEY_PAUSED

- ID Journey ID
- Data

- $\circ\,$ Timestamp time stamp when the message was entered in the topic
- State PAUSED

- ID: journeyID
- state: enum:PAUSED
- timestamp
- data: <empty>

PARSED

- ID Journey ID
- Data
 - $\,\circ\,$ Timestamp time stamp when the message was entered in the topic
 - State PARSED

Object Type

- ID: journeyID
- state: enum:PARSED
- timestamp
- data: <empty>

MAPPED

- ID Journey ID
- Data
- · Timestamp time stamp when the message was entered in the topic
- State PARSED

Object Type

- ID: journeyID
- state: enum:MAPPED
- timestamp
- data: <empty>

FETCHED

- ID Journey ID
- Data
- Timestamp time stamp when the message was entered in the topic
- ${}_{\circ}$ List of record IDs

- ID: journeyID#nodeID
- state: enum:FETCHED
- timestamp
- numberRecords:
- listRecords:

DELAY_EXECUTED

- ID this ID shall be the Journey ID and the node ID for the following node
- Data
- State DELAY_EXECUTED
- \circ Timestamp time stamp when the message was entered in the topic
- List of record IDs

Object Type

- ID: journeyID#nodeID
- state: enum:DELAY_EXECUTED
- timestamp
- numberRecords:
- listRecords:

EMAIL_SENT

- ID this ID shall be the Journey ID and the node ID for the following node
- Data
- State EMAIL_SENT
- $\circ\,$ Timestamp time stamp when the message was entered in the topic
- List of record IDs

Object Type

- ID: journeyID#nodeID
- state: enum:EMAIL_SENT
- timestamp
- numberRecords:
- listRecords:

JOURNEY_PARSE

This topic shall hold all messages for journeys to be validated and parsed.

- ID Journey ID
- Data
- Timestamp time stamp when the message was entered in the topic
- State PARSE
- ∘ Data

- ID: journeyID
- state: enum:PARSE
- timestamp
- data: <empty>

JOURNEY_CACHE

This topic shall hold all messages for Journey Data that needs to be added to the cache.

Message Attributes

- Journey ID
- Entry Source ID
- Data
- Timestamp time stamp when the message was entered in the topic
- ∘ `Data

Object Type

- ID: journeyID
- state: enum:PARSE
- timestamp
- data: <empty>

ASYNC_DATABASE_INSERTS

This topic shall hold all messages that are to be inserted into some database table asynchronously.

- Entity
- Name
- Message
- Timestamp

JOURNEY_MAP

This topic shall hold all messages for the Journey Map Service. This data shall consist of all the details of each Entry Source associated with the Journey.

Message Attributes

- Journey ID
- Data
- List of Entry Sources for the Journey, which includes ID, type and FQN

JOURNEY_DATA

This topic shall hold all messages that are to be pushed to database tables for log or state information. These messages do not impact execution of the Journey.

Message Attributes

- Service ID
- Data
- Query
- Timestamp

EMAIL_SEND

This topic shall hold all the messages from the running instances of journeys that need emails to be sent out.

Message Attributes

- ID this shall be a combination of the Journey ID and Node ID
- Audience IDs the list of audience IDs that are to be sent the email

OUTGOING_EMAIL

This topic shall hold all the messages from the Journey application that need to be sent out as emails. These will either be acted upon by a suitable Adaptor Service or the Universal Connector.

Message Attributes

- sourceAppId: name of application Journey
- sourceInstanceId Touch Point ID
- Audiences List of audience data

EMAIL_RESPONSES

This topic shall hold all the messages received from the delivery engine via configured connector as audience response events to emails sent.

Message Attributes

- Touch Point ID
- Audience ID
- Event ID
- Timestamp

OUTGOING_SMS

This topic shall hold all the messages from the Journey application that need to be sent out as SMS's. These will either be acted upon by a suitable Adaptor Service or the Universal Connector.

Message Attributes

- sourceAppId: name of application Journey
- sourceInstanceId Touch Point ID
- Audiences List of audience data

SMS_RESPONSES

This topic shall hold all the messages received from the delivery engine via configured connector as audience response events to SMS's sent.

Message Attributes

- Touch Point ID
- Audience ID
- Event ID
- Timestamp

DELAY

This topic shall hold all the messages from the running instances of journeys that need to add a delay before the execution of the following touch point.

Message Attributes

- ID this shall be a combination of the Journey ID and Node ID
- Configuration this shall be the configuration data for the Delay Touch Point
- Structure this shall be the JSON structure extracted from the Journey JSON

DECISION_SPLIT

This topic shall hold all the messages from the running instances of journeys that need to split incoming data based on some filter.

- ID this shall be a combination of the Journey ID and Node ID
- Configuration this shall be the configuration data for the Decision Split Touch Point
- Structure this shall be the JSON structure extracted from the Journey JSON

JOURNEY_PAUSE

This topic shall hold messages from the Orchestration Service to pause a specific Journey.

Message Attributes

• ID - the ID of the Journey which must be Paused

DATA_PAUSED

This topic shall hold all the messages from the running instances of Journeys that have been Paused.

Message Attributes

- Name name of the Source topic
- ID the Journey ID
- Message the original message

JOURNEY_RESUME

This topic shall hold messages from the Orchestration Service to resume a specific Journey.

Message Attributes

• ID - the ID of the Journey which must be Resumed

DATA_RESUMED

This topic shall hold all the messages that were in the Paused state but now need to be resumed by the individual Services.

Message Attributes

- Name name of the Source topic
- ID the Journey ID
- Message the original message

JOURNEY_ENGINE_ERRORS

This topic shall hold all the messages from the engine which are errors that took place and that could be displayed on the Web on an administrative console when required.

- ID Some ID that identifies the entity that caused the error Journey ID, Audience ID
- State State of the error MEDIUM / HIGH / CRITICAL
- Category Name of the Service that detected the error
- Text The actual error text

JOURNEY_GOAL_VERIFICATION

This topic shall hold all messages for the Journey Goal Verification Service which needs to verify if the goal for the Journey has been achieved.

Message Attributes

- ID Journey ID
- EVENT_TYPE EMAIL RESPONSE, SMS_REPOSNE, PUSH_RESPONSE
- Data
- Timestamp

JOURNEY_GOAL_ACHIEVED

This topic shall hold messages for the Service that handles notification for when a Journey has achieved the set goal.

Message Attributes

- ID Journey ID
- EVENT_TYPE TIME, COUNT
- Timestamp

JOURNEY_ENGINE_MONITORING

This topic shall be used by the Engine to send monitoring data across to the web.

Message Attributes

- Name Name of Service is message refers to a Service or then ENGINE indicating that the message is for Journey Engine as a whole
- State STARTING, GOING DOWN, NOT RESPONDING
- Thread ID
- Timestamp
- IP Address

States, Types & Status

- 1. ENTRY SOURCE TYPES
 - Flat File
 - ∘ REST
- 2. DATA PIPELINE STATUS

- Imported
- Cleaned
- Mapped
- 3. LOG TYPES
 - File
- 4. LOG SUB TYPES
- 5. DATA PIPELINE STATES

6. JOURNEY STATES

- \circ PUBLISHED when the Journey is pushed into the Published state from the front end
- PARSED when the Journey is parsed successfully
- RUNNING when the Journey has mapped data and has begun execution
- PAUSED when the Journey has been Paused, either explicitly or implicitly. The current Run of the Journey shall be completed
- STOPPRED when the Journey has been Stopped, either explicitly or implicitly. The current Run of the Journey shall be terminated
- \circ COMPLETED when the Journey has completed its logical execution
- $\,\circ\,$ GOAL ACHIEVED when the Journey has achieved its defined goal

7. AUDIENCE TABLE STATES

- \circ NEW these are new records for a given Journey ID, that have not been processed
- \circ PROCESSED these are records for a given Journey ID, that have been processed
- \circ COMPLETED these audience for a given Journey have completed the Journey the logical end
- · GOAL ACHEIVED the Journey associated with these audience has achieved its goal

Chapter 6. Process of Starting and Stopping Journey

About this task

Starting Process

1. Starting Process Web

- a. Configure Kafka and Zookeeper
 - i. IP on which Zookeeper/Kafka is running
 - ii. PORT- Kafka(default 9092), Zookeeper default port 2181
 - iii. Log path
 - iv. auto.create.topic.enable = true, this property should be set to true for Engine Publish service to work.
- b. Start Zookeeper, wait 10 sec
- c. Start kafka
- d. configure Journey.xml --(Refer Doc, Doc2)
- e. Configure Log4j2.xml under conf folder
- f. Start Webserver (JBOSS/TOMCAT/WebSphere)
- g. Start Journey Web application
- 2. Starting Engine
 - a. Configure application.porperties
 - i. Add DB Details
 - ii. Add Kafka details(eg: spring.kafka.bootstrap-servers=127.0.0.1:9092, 127.0.0.2:9092)
 - Path for Ignite Storage, spring.ignite.storage.path, User thru which engine is executed should have Read and Write access to the path of Ignite folder
 - iii. Configure Log4j2.xml under conf folder
 - iv. Configure property spring.ignite.ipFinder.List as below:
 - spring.ignite.ipFinder.List=127.0.0.1:63501,127.0.0.1:63502, 127.0.0.1:63503,127.0.0.1:63504
 - v. Start Engine (java jar journeyEngine.jar)

Stopping Process (Steps for No Data Loss)

- a. Stop Webserver
- b. Stop Engine Use Director or find the Journey engine process ID & run below command
 - Linux → kill -SIGINT [engine-process-id] OR kill -2 [engine-process-id]
 - Windows → taskkill /PID [engine-process-id]
- c. Stop kafka
- d. Stop Zookeeper

 a. If user see below error while starting Journey Web or Engine or Data migration utility on MS sql server DB please apply given workaround:

Error: Caused by: javax.net.ssl.SSLHandshakeException: sun.security.validator.ValidatorException: PKIX path building failed: sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid certification path to requested targetThe driver could not establish a secure connection to SQL Server by using Secure Sockets Layer (SSL) encryption. Error: "sun.security.validator.ValidatorException: PKIX path building failed: sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid certification path to requested target". ClientConnectionId:7a73f167-03c7-4a8c-880b-a9f63f9028f6]]

Workaround:

Please add ;encrypt=false;trustServerCertificate=false; to jdbc url for journey system database and report database

eg. url="jdbc:sqlserver://

<DB_HOST_IP>:<PORT_NO>;databaseName=<databaseName>;encrypt=false;trustServerCertificate=false;"/>

b. If user see below error while starting Journey Web on Tomcat, please apply below workaround in tomcat

Error: org.apache.catalina.util.LifecycleBase.handleSubClassException Failed to start component [Connector[AJP/1.3-8010]] org.apache.catalina.LifecycleException: Protocol handler start failed

Workaround:

Please ensure that secretRequired="false" for ajp connector

Path-> C:\apache-tomcat\instance\conf\server.xml

<Connector port="8010" protocol="AJP/1.3" redirectPort="8444" secretRequired="false" />

Chapter 7. Journey user roles and permissions

Before you begin using Unica Journey, you should assign roles and permissions to users.

- Assigning permissions to Journey Roles on page 39
- Assigning JourneyAdmin role to a user on page 40
- Assigning JourneyUser role to a user on page 41

Note: Any changes in configuration requires a restart of Unica Journey. For more information related to security configurations, see *Unica Platform Administrator's Guide*.

Assigning permissions to Journey Roles

Before assigning a role to a user, you should assign permissions to the available roles.

About this task

Journey offers two user roles:

- JourneyAdmin
- JourneyUser

To assign permissions to both roles, complete the following steps:

1. From the Unica Platform home page, select Settings > User roles and permissions.

Result

The User roles and permissions page appears.

2. In the left panel, expand Unica Journey > partition1.

Result

The partition1 page appears.

3. Select Assign Permissions.

Result

The (Properties for administrative roles) page appears.

4. Click Save and edit permissions.

Result

The (Permissions for partition1) page appears.

- 5. Expand **Application**.
- 6. Set values for the following fields:

Operations	JourneyAdmin Default setting	JourneyUser Default setting
Create Data Definition	Yes	No
Edit Data Definition	Yes	No

Operations	JourneyAdmin Default setting	JourneyUser Default setting
Delete Data Definition	Yes	No
Create Entry Sources	Yes	No
Edit Entry Sources	Yes	No
Delete Entry Sources	Yes	No
Create Journey	Yes	Yes
Edit Journey	Yes	Yes
Delete Journey	Yes	No
Publish Journey	Yes	Yes
Complete Journey	Yes	Yes
Pause Journey	Yes	Yes
Goal add/modify/delete	Yes	No
Goal view	Yes	Yes
Settings add/modify/delete	Yes	No
Settings view	Yes	Yes

- For the JourneyAdmin role, we recommend that you do not reduce the permissions and retain the default permissions. By default, JourneyAdmin has all permissions.
- For the JourneyUser role, provide permissions that you feel is appropriate. You can give the JourneyUser all permissions, but it is not recommended.
- 7. After providing the permissions, click **Save changes**.

Assigning JourneyAdmin role to a user

To assign JourneyAdmin role to a user, complete the following steps:

1. From the Marketing Platform home page, select Settings > User roles and permissions.

Result

The User roles and permissions page appears.

- 2. In the left panel, expand Unica Journey.
- 3. Select partition1 > JourneyAdmin.

Result

The JourneyAdmin page appears.

4. In the Users section, select a user. For example, ${\tt asm_admin}.$

Result

The asm_admin (asm_admin) user details page appears.

5. Select Edit roles.

Result

The Edit roles page appears.

- From the Available roles list, select JourneyAdmin (Unica Journey) and click the >> button to move the role to the Selected roles list.
- 7. Click Save changes.

Assigning JourneyUser role to a user

To assign JourneyUser role to a user, complete the following steps:

1. From the Marketing Platform home page, select Settings > User roles and permissions.

Result

The User roles and permissions page appears.

- 2. In the left panel, expand Unica Journey.
- 3. Select partition1 > JourneyUser.

Result

The JourneyUser page appears.

4. In the Users section, select a user. For example, journey_example.

Result

The journey_example (journey_example) user details page appears.

5. Select Edit roles.

Result

The Edit roles page appears.

- From the Available roles list, select JourneyUser (Unica Journey) and click the >> button to move the role to the Selected roles list.
- 7. Click Save changes.

Assigning ContactCentralAdmin role to a user

Unica Journey administrator must assign the ContactCentralAdmin role to Journey users for them to access Contact Central. For enabling the contact central for Journey the value of Contact_Central_Configured value should be set to 'Yes' from platform. By default, the value is set to No. User can select the desired value Yes/No for Contact_Central_Configured from the path Affinium|Journey in Platform. For more information, see *Unica Contact Central Administration Guide*.

Chapter 8. Journey interaction logging

Interaction Logging for Journey is executed as a scheduled job. The scheduling parameters are set in application.properties file of the Journey Engine. The following is an example of the setting:

engine.logging.cron=0 15 3 * * ?

The scheduled job exports data into an alternative schema which is defined again in the application.properties files of the Journey Engine.

```
journey.report.datasource.url =
journey.report.datasource.username =
journey.report.datasource.password =
journey.report.datasource.driver-class-name=
```

Interaction Logging captures the movement of every contact that enters the Journey application as they move through each Journey, either Published or Completed. Even journeys that are Published but Paused are considered for the Interaction Logging.

All Touchpoints, Email, SMS, or CRM, are considered for Interaction Logging as the audience data is sent using the configured integrations through the respective channels. The responses received, from every contact, is also captured.

Log4j2

Both Journey Web and Journey Engine uses the standard for logging. The log4j2.xml file, for both Journey Web and Journey Engine, is placed within the conf folder in the installation location.

Both Journey Web and Journey Engine produce regular application logs as well as performance logs. For Journey Web, the default location of the logs is within the logs folder. For Journey Engine, the default location of the logs is within the performancelogs folder. For both Journey Web and Journey Engine, the mentioned folders are placed within the installation location.

Chapter 9. Journey logging

In Journey version 12.1.2 and earlier, the property JOURNEY_LOGGING, in the <code>journey_master_config.properties</code> file, was only used for tracing the audience.

From version 12.1.3 onwards, the JOURNEY_LOGGING feature has the following enhancements:

- Indication of whether the Journey started or not at the default Journey engine log level.
- Easy to customize the logging to display any the following logs: FATAL, ERROR, WARN, INFO, DEBUG, TRACEAUDIENCE, OF TRACE.
- Logs Read-from Kafka and Write-to Kafka at Trace level.
- Creating multiple log files per Journey.

Configuring the JOURNEY_LOGGING property

The rules for configuring the JOURNEY_LOGGING property are as follows:

- 1. Access the journey_master_config.properties file and locate the JOURNEY_LOGGING property.
- 2. Uncomment the property for editing it an providing values.
- 3. The values must be CSV strings and the format of each string must be $J_ID:LEVEL$, where:
 - \circ J_ID is the Journey ID
 - LEVEL can one of the following values: fatal, error, warn, info, debug, traceaudience, or trace. The order of LEVEL values from highly specific to less specific are as follows: fatal, error, warn, info, debug, traceaudience, or trace
- 4. The default value of *J_ID:LEVEL* is an empty string. To modify the value of *J_ID:LEVEL*, uncomment it and provide the required value.
- 5. To adjust the default value of the logger com.hcl.journeyLogger, access log4j2.xml and make the changes. Ensure that the log levels configured must be specific to the one in log4j2.xml.
- 6. After configuring J_ID:LEVEL, the system creates a J_ID.log file. This log file is specific to the Journey ID. If you want to check the logs of multiple Journeys, configure multiple J_ID:LEVEL separated by a comma. The system creates a J_ID.log files, each for a Journey ID.
- 7. If you apply DEFAULT:<LEVEL> for all Journeys excluding the ones specified in JOURNEY_LOGGING:
 - a. If you do not provide value for DEFAULT, it is considered as OFF.
 - b. If $J_ID:LEVEL$ is not configured in Journey Logging, the log levels of log4j2.xml is considered.
- 8. To capture the logs of Ignite cache(Delay/ES/DS/Wait4Capacity), provide the values in the following format:

JOURNEY_LOGGING=181#361:DEBUG,<J_ID>#<NODE_ID>:DEBUG

where:

 $<J_ID>$ is the Journey ID and $<NODE_ID>$ is the Node ID.

Note:

- Changes are automatically reloaded within 60 seconds.
 - If you configure log level per package/class level in log4j2, ensure that JOURNEY_LOGGING is empty or commented. The combination of journey log level and class specific log config is not supported.

JOURNEY_LOGGING=Archival:WARN - This parameter is used to set the desired logging level for Journey Engine.

- spring.jpa.properties.hibernate.jdbc.batch_size=900 This parameter specifies the max number of records in a batch for insert and update using JDBC connection. changing this value may impact the Engine performance.
- spring.jpa.properties.hibernate.order_inserts=true This parameter specifies if insert statements should be batched or not.
- spring.jpa.properties.hibernate.order_updates=true This parameter specifies if insert statements should be batched or not.
- journey.kafka.producer.linger.ms=500 Time in milliseconds Kafka producer waits for gathering 16kb (default) data before making network dispatch
- audience.archival.cron This is used to mention the archival cron job for the Journey Audience table.

Log4j

In case of log4j2.xml class or package configurations, access the log4j2.xml file and use the following example by uncommenting it:

```
<Logger name="<<class name>> or <<package name>>" level="<<log level>>" additivity="false">
<appender-ref ref="Routing"/>
<appender-ref ref="console"/>
</Logger>
```

where:

- <<class name>> is the fully qualified class name
- <<p>package name>> is the fully qualified package name
- <</og level>> is one of the log levels as mentioned in Configuring the JOURNEY_LOGGING property on page 43.

Interact

interact.startSession.enabled=false/true

This is a setting in Jounrey Engine's application.properties file to enable debugging the communication between Journey and Interact.

Setting the value to true enables the Debug messages

Chapter 10. Journey Records Validation

When records enter a Journey, users can set validation on the records.

When the **Validations_On_Journey_Records** property is set to <u>ves</u>, the validation is performed on Email format, Data type on required fields, and minimum and maximum length of Data Definition for the required fields.

By default, the Validations_On_Journey_Records property is set to Yes.

This property can be handled from Platform side under Platform Configuration. You can navigate under Platform configuration settings: Settings for Affinium | Journey | Journey_Configurations.

Validations_On_Journey_Records: This flag defines whether to run validation on Journey records.

Possible values: Yes / No.

- If the Validations_On_Journey_Records property is set to No, and the user adds some fields in data deduplication setting, the empty and NULL data will not be accepted for data deduplication fields.
- After setting the flag, you must log out from Platform and Journey and log back in to both applications for the changes to reflect.
- For any reason, if the **Validations_On_Journey_Records** property is not accessible in Journey from Platform, you can alternatively set the <code>journey.journeyrecords.validationrules</code> property in the <code>application.properties</code> file from Journey web. In this case the value **True** takes the precedence.

For Example - If platform config is set to true and property file has false, then platform config value true will take the precedence. If platform config is set to false and property file has true, then property file value true will take the precedence. If both platform and property file has value as false, only then the validation will not happen.

Chapter 11. Configuring OptIn Optout functionality

In 12.1.9 release, Journey supports opt out/in for Email, SMS and Whatsapp channels. Opt out/in is not supported for Push channel.

Journey touchpoint respect the contact central preferences before executing for Opt-in Opt-out specific to the channel and do not send communication if audiences are opted out. This should apply to both Link and Deliver type of touchpoint.

To enable the Opt-Out functionality in Journey, users must have Contact Central installed and enabled in Unica and along with Journey partition wise contact central flag should be enabled.

A scheduler is default configured to fetch audience data every 12 hours from Contact Central to Journey. Users can modify the schedule by updating below property available in the engine's application.properties file. Every time when jobs executed Journey will take only updated and delta audiences from Control Central to Journey.

engine.contactcentral.consent.data.cron=0 0 */12 * * ?

When above consent jobs executed by Journey engine at set frequency, opted out audiences data is retrieved from Contact Central and stored in the Journey channel wise consent database tables.

Database tables : journeyaudiencewhatsappconsent, journeyaudiencesmsconsent, JourneyAudienceEmailConsent.

Optional: The default page size for storing data in the Journey tables is 1,000 records per iteration. To change this, users can set engine.contactcentral.consent.pagesize=2000 (or another desired value) in the engine's application.properties file.

After making any changes to the application.properties file, users must restart the engine service for the changes to take effect.

Chapter 12. Journey GDPR

Accessing Journey GDPR

You can access the GDPR tool from the Journey application folder. The location is as follows:

<Journey_Home>\Journey\tools\GDPR\

GDPR supports > MariaDB, MS Sql server, OneDb data bases along with Oracle

Executing Journey GDPR

To execute Journey GDPR, complete the following steps:

1. Make changes to the following properties in the gdpr.properties file:

Property Name	Example value	Notes
Journey.audience.DBType	ORACLE	Currently, Journey supports only Oracle.
Journey.audience.Db. Schema.Name	JourneyUser	Schema name used in the Journey database.
Journey.audience.Field	email/mobileNumber	Field name in the input \mathtt{CSV} file.
Journey.audience.Csv	<gdpr_home>/sample/JourneyAudiences .csv</gdpr_home>	Replace <gdpr_home> with the current directory path.</gdpr_home>
		This is the input csv file containing records that you need to opt out from the Journey.
Journey.audience.Output	<gdfr_home>/JourneyAudiences.sql</gdfr_home>	The JourneyAudiences.sql is the output file name containing all the SQL queries used to drop all the records from the Journey application. Replace <gdpr_home> with the current directory path.</gdpr_home>
Journey.audience.Output. FileSizeLimit	10	Value is in MBs. When the file size exceeds the entered value, it will generate multiple files with the following suffixes: JourneyAudiences _0, JourneyAudiences _1, and so on.

- 2. Note: If you see any errors, you can trace it using this log file.
- 3. To execute the file, perform one of the following steps:
 - a. For Windows, locate and execute the gdpr_purge.bat file. For example, if the file gdpr_purge.bat is in the D:\workspace\HCL_GDPR\dist\journey\ location, run the gdpr_purge.bat file.
 - b. For UNIX-based systems, locate and execute the gdpr_purge.sh file. For example, if the file gdpr_purge.sh is in the \workspace\HCL_GDPR\dist\journey\ location, run the command ./gdpr_purge.sh.
- 4. After running gdpr_purge.bat (for Windows) or gdpr_purge.sh (For Linux), output files "JourneyAudiences 0", "JourneyAudiences _1", "JourneyAudiences _2" and so on will be generated at location <GDPR_HOME> specified in above steps. Number of files generated will depend on filesize specified.
- 5. "JourneyAudiences_x" file will have delete queries for records mentioned in JourneyAudiences.csv
- 6. These queries need to be run manually in "Journey" database as required to have the records deleted from the journeyaudiences table.

GDPR utility removes records from following table: JourneyAudiences, AudienceResponse, AudienceResponseMetaData, AudienceResponseInteraction, JourneyAudienceMilestone and JourneyAudienceGoal. However, it does not delete the data from respective tables, where aggregated counts are stored. For example, tables like journeyFlow, journeyAudienceFlow, JourneyGoalContactTransaction etc. Hence, there will be count mismatch on UI.

With GDPR tool, user would not be able to delete the customer data from either Publish Kafka topic or from the files available on the file system. User need to Delete this data manually as per their requirement.

With GDPR tool user will not able to delete customer data exported by JDBC connector.

Chapter 13. Kafka authentication using SSL

If you are using your organization's Kafka instance, you can use certificates configured for that Kafka instance. You are not required to generate SSL key and certificates and obtain the client certificates to configure in Journey application properties.

If you do not have the certificates, you can generate self-signed certificate authority (CA), which is simply a public-private key pair and certificate.

You must add the same CA certificate to each Kafka client and broker's trust store.

Generate SSL key and certificate for each Kafka broker

To generate self-signed certificates for Kafka server, complete the following steps.

Prerequisites

- You must have Java keytool and OpenSSL to generate certificates and trust store.
- Optionally, you can use any SSL certificate generation utility instead of OpenSSL.
- 1. To deploy SSL, generate the key and the certificate for each machine in the cluster. Generate the key into a temporary keystore initially so that you can export and sign it later with CA.

keytool -keystore kafka.server.keystore.jks -alias localhost -validity 365 -genkey

- keystore: The keystore file that stores the certificate. The keystore file contains the private key of the certificate; therefore, it needs to be kept safely.
- validity: The valid time of the certificate in days.
- 2. Create your own CA (certificate authority)

openssl req -new -x509 -keyout ca-key -out ca-cert -days 365

The generated CA is simply a public-private key pair and certificate, and it is intended to sign other certificates.

- 3. Add the generated CA to the clients' trust store so that the clients can trust this CA.
 - ° keytool -keystore kafka.server.truststore.jks -alias CARoot -import -file ca-cert
 - ° keytool -keystore kafka.client.truststore.jks -alias CARoot -import -file ca-cert
- 4. Sign all certificates in the keystore with the CA generated.
 - a. Export the certificate from the keystore:

keytool -keystore kafka.server.keystore.jks -alias localhost -certreq -file cert-file

5. Sign it with CA.

openssl x509 -req -CA ca-cert -CAkey ca-key -in cert-file -out cert-signed -days 365 -CAcreateserial -passin pass:<password>

6. Import both the certificates of the CA and the signed certificate into the keystore.

keytool -keystore kafka.server.keystore.jks -alias CARoot -import -file ca-cert

keytool -keystore kafka.server.keystore.jks -alias localhost -import -file cert-signed

7. Create client keystore and import both certificates of the CA and signed certificates to client keystore. These client certificates will be used in application properties.

```
keytool -keystore kafka.client.keystore.jks -alias localhost -validity 365 -genkey
keytool -keystore kafka.client.keystore.jks -alias localhost -certreq -file cert-file
openssl x509 -req -CA ca-cert -CAkey ca-key -in cert-file -out cert-signed -days 365 -CAcreateserial -passin
pass:<password>
```

keytool -keystore kafka.client.keystore.jks -alias CARoot -import -file ca-cert

keytool -keystore kafka.client.keystore.jks -alias localhost -import -file cert-signed

Configuring Kafka server, Journey and Link components with SSL

The server certificates to be used for Kafka server and client certificates must be used by any application connecting to Kafka server including Journey Web, Journey Engine, Unica Link – Kafka-link or any other tools you require to connect to this Kafka server.

To configure Kafka Server, Journey components, and Link component with SSL authentication, execute the procedures provided in the following sections.

Configuring Kafka Server with SSL authentication

You must use the following server certificates for Kafka server only. Share these certificates on the required machines and make a note of password.

```
    kafka.server.keystore.jks
```

• Kafka.server.truststore.jks

Update the following server.properties in Kafka server config directory.

```
listeners=SSL://<KAFKA_HOST>:<KAFKA_PORT>
ssl.keystore.location=/PATH/kafka.server.keystore.jks
ssl.keystore.password= password
ssl.key.password= password
ssl.truststore.location= /PATH/kafka.server.truststore.jks
ssl.truststore.password= password
ssl.endpoint.identification.algorithm=
ssl.client.auth=required
security.inter.broker.protocol=SSL
```

Configure Journey engine with Kafka SSL

Use the following client certificates and share these certificates on the required machines and make a note of password.

- Kafka.client.keystore.jks
- kafka.client.truststore.jks
- 1. Update journey_engine_master.config from <JOURNEY_HOME>/Engine/ directory.
- 2. Update the following property values.

```
kafka.security.enabled=Y
kafka.security.protocols.enabled=SSL
security.protocol=SSL
ssl.truststore.location= /PATH/kafka.client.truststore.jks
ssl.truststore.password=<ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION
TOOL>
ssl.keystore.location= /PATH/kafka.client.keystore.jks
ssl.keystore.password=<ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION TOOL>
ssl.key.password=<ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION TOOL>
ssl.endpoint.identification.algorithm=
```

Configuring Journey web with Kafka SSL

- 1. Update Journey Web application.properties file from <JOURNEY_HOME>/Web/properties/ directory.
- 2. Update the following property values.

```
kafka.security.enabled=Y
kafka.security.protocols.enabled=SSL
ssl.truststore.location= /PATH/kafka.client.truststore.jks
ssl.truststore.password= <ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION
TOOL>
ssl.keystore.location= /PATH/kafka.client.keystore.jks
ssl.keystore.password= <ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION
TOOL>
ssl.key.password= <ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION TOOL>
ssl.endpoint.identification.algorithm=
```

Configuring Unica Link component with SSL

Update the following property values in Unica Link installations - kafkalink.properties file.

```
security.ssl=true
security.protocol=SSL
ssl.truststore.location= /PATH/kafka.client.truststore.jks
ssl.truststore.password=password
security.authentication=username
ssl.keystore.location= /PATH/kafka.client.keystore.jks
ssl.keystore.password=password
ssl.key.password=passwordssl.endpoint.identification.algorithm=
```

Configuring Kafka server, Journey and Link Components with SASL

To configure Kafka Server, Journey components, and Link component with SASL authentication, execute the procedures provided in the following sections.

Configuring Kafka Server with SASL authentication

1. Specify JVM parameter in kafka-run-class.bat/sh.

Set JAVA_OPTS=%JAVA_OPTS%

-Djava.security.auth.login.config=/PATH/kafka_server_jaas.conf

set COMMAND=%JAVA% %JAVA_OPTS% %KAFKA_HEAP_OPTS%

%KAFKA_JVM_PERFORMANCE_OPTS% %KAFKA_JMX_OPTS% %KAFKA_LOG4J_OPTS% -cp

"%CLASSPATH%" %KAFKA_OPTS% %*

Sample jaas.config file:

```
KafkaServer {
    org.apache.kafka.common.security.plain.PlainLoginModule required
    username="admin"
    password="admin-secret"
    user_admin="admin-secret"
    user_alice="alice-secret";
};
```

```
KafkaClient {
    org.apache.kafka.common.security.plain.PlainLoginModule required
    username="alice"
    password="alice-secret";
};
```

2. Update the following Kafka server properties file from KAFKA_SERVER/config/server.properties.

```
listeners=SASL_PLAINTEXT:// <KAFKA_HOST>:<KAFKA_PORT>
security.inter.broker.protocol=SASL_PLAINTEXT
sasl.mechanism.inter.broker.protocol=PLAIN
sasl.enabled.mechanisms=PLAIN
```

3. In case of WebSphere App server

Add following configuration in configuration profilesspofileName profilesspo<pr

```
KafkaClient
{org.apache.kafka.common.security.plain.PlainLoginModule required
username="alice"
password="alice-secret"; }
```

4. Once you've updated the JAAS configuration, ensure that WebSphere knows about it.

Add this to the JVM arguments:

- Open WebSphere Admin Console.
- Go to Servers > Server Types > WebSphere application servers > Select your server > Java and Process Management > Process Definition > Java Virtual Machine > Custom Properties.
- Add a new custom property:

- Name: java.security.auth.login.config
- Value: C:\path\to\your\kafka_client_jaas.conf

Configure Journey Engine with Kafka SASL

1. Update Journey Engine log4j2.xml file from <JOURNEY_HOME>/Engine/conf/ directory. Uncomment the following lines in log4j2.xml.

```
<!-- Kafka SASL configuration -->
<Property name="security.protocol">${sys:security.protocol}</Property>
<Property name="sasl.mechanism">${sys:sasl.mechanism}</Property>
```

 Update journey_engine_master.config from <JOURNEY_HOME>/Engine/ directory. Update the following property values.

```
kafka.security.enabled=Y
kafka.security.protocols.enabled=SASL_PLAINTEXT
security.protocol=SASL_PLAINTEXT
sasl.mechanism=PLAIN
java.security.auth.login.config=./kafka_client_jaas.conf
```

Configuring Journey Web with Kafka SASL

Update Journey Web application.properties file from <JOURNEY_HOME>/Web/properties/ directory.

```
kafka.security.enabled=Y
kafka.security.protocols.enabled=SASL_PLAINTEXT
java.security.auth.login.config=/PATH/kafka_client_jaas.conf
```

Configuring Unica Link component with Kafka SASL

Update the following property values in Unica Link installation - kafkalink.properties file.

```
security.sasl =true
security.protocol=SASL_PLAINTEXT
security.sasl.auth.login.config =/PATH/kafka_client_jaas.conf
sasl.mechanism=PLAIN
```

Configuring Kafka server and Journey Components with SASL_SSL configuration

To configure Kafka Server and other Journey components with SASL authentication, complete the procedures provided in the following sections.

Note: Unica Link does not support connecting to Kafka-link using SASL_SSL authentication mechanism. You must either use SASL or SSL authentication mechanism.

Configuring Kafka Server with Kafka SASL_SSL

Update the following server.properties in Kafka server configuration directory.

```
listeners=SASL_SSL:// <KAFKA_HOST>:<KAFKA_PORT>
security.inter.broker.protocol=SASL_PLAINTEXT
sasl.mechanism.inter.broker.protocol=PLAIN
sasl.enabled.mechanisms=PLAIN
ssl.keystore.location=/PATH/kafka.server.keystore.jks
ssl.keystore.password=password
ssl.truststore.location=/PATH/kafka.server.truststore.jks
ssl.truststore.password= password
ssl.endpoint.identification.algorithm=
ssl.client.auth=required
security.inter.broker.protocol=SSL
```

1. In case of WebSphere App server

 $\label{eq:add_following} and \end{tabular} configuration in websphere_location>profilesprofileName>propertieswsjaas.configuration$

```
KafkaClient
{org.apache.kafka.common.security.plain.PlainLoginModule required
username="alice"
password="alice-secret"; }
```

2. Once you've updated the JAAS configuration, ensure that WebSphere knows about it.

Add this to the JVM arguments:

- Open WebSphere Admin Console.
- Go to Servers > Server Types > WebSphere application servers > Select your server > Java and Process Management > Process Definition > Java Virtual Machine > Custom Properties.
- Add a new custom property:
 - Name: java.security.auth.login.config
 - Value: C:\path\to\your\kafka_client_jaas.conf

Configuring Journey Engine with Kafka SASL_SSL

1. Update Journey Engine log4j2.xml file from <JOURNEY_HOME>/Engine/conf/ directory.

Uncomment the following lines in log4j2.xml.

```
<property name="sasl.mechanism">${sys:sasl.mechanism}</property>
<property name="security.protocol" >${sys:security.protocol}</property>
<property name="ssl.truststore.location" >${sys:ssl.truststore.location}</property>
<property name="ssl.truststore.password">${sys:ssl.truststore.password}</property>
<property name="ssl.keystore.location">${sys:ssl.truststore.password}</property>
<property name="ssl.keystore.location">${sys:ssl.truststore.password}</property></property>
```

```
<Property name="ssl.keystore.password">${sys:ssl.keystore.password}</Property>
<Property name="ssl.key.password">${sys:ssl.key.password}</Property>
<Property
name="ssl.endpoint.identification.algorithm">${sys:ssl.endpoint.identification.algorithm}</Property>
```

2. Update the following journey_engine_master.config from <JOURNEY_HOME>/Engine/ directory.

Update the following property values.

```
kafka.security.enabled=Y
kafka.security.protocols.enabled=SASL_SSL
ssl.truststore.location=/PATH/kafka.client.truststore.jks
ssl.truststore.password=<ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION TOOL>
ssl.keystore.location=/PATH/kafka.client.keystore.jks
ssl.keystore.password=<ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION TOOL>
ssl.key.password=<ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION TOOL>
ssl.endpoint.identification.algorithm=
java.security.auth.login.config=/PATH/kafka_client_jaas.conf
```

Configuring Journey Web with Kafka SASL_SSL

Update the following Journey Web application.properties file from <JOURNEY_HOME>/Web/properties/ directory.

```
kafka.security.enabled=Y
kafka.security.protocols.enabled=SASL_SSL
ssl.truststore.location=/PATH/kafka.client.truststore.jks
ssl.truststore.password=<ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION TOOL>
ssl.keystore.location=/PATH/kafka.client.keystore.jks
ssl.keystore.password=<ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION TOOL>
ssl.key.password=<ENCYPTED PASSWORD WITH JOURNEY ENCRYPTION TOOL>
ssl.endpoint.identification.algorithm=
java.security.auth.login.config=/PATH/kafka_client_jaas.conf
```

Configuring Journey Web with Kafka SASL_SSL and mechanism SCRAM-SHA-512

```
spring.kafka.bootstrap-servers=<kafka brokers list>
kafka.security.protocols.enabled=SASL_SSL
sasl.mechanism=SCRAM-SHA-512
ssl.truststore.enable=N0
java.security.auth.login.config= <Path to file - kafka_jaas.conf>
```

Configuring Journey Engine with Kafka SASL_SSL and mechanism SCRAM-SHA-512

Update the below changes in application.properties:

```
spring.kafka.bootstrap-servers=<kafka brokers list>
ssl.truststore.enable=N0
```

Changes in journey_master_config.properties

```
kafka.security.protocols.enabled=SASL_SSL sasl.mechanism=SCRAM-SHA-512
```

ssl.truststore.enable=N0
java.security.auth.login.config= <Path to file - kafka_jaas.conf>

Affinium|Journey|Kafka_Configurations

KafkaBrokerURL

Description

Use this property to define IP and port on which Zookeeper or Kafka is running.

Default value

No default value defined.

Valid Values

Any valid Kafka broker URL.

CommunicationMechanism

Description

Specifies the configuration for Kafka client authentication.

Default value

No default value defined.

Valid Values

In the Kafka configurations page, you can select one of the following values for the CommunicationMechanism field depending on your organization's Kafka server's stream security.

- NO_SASLPLAINTEXT_SSL
- SASL_PLAINTEXT
- SSL
- SASL_PLAINTEXT_SSL

sasl.mechanism

Description

Specifies the Kafka client authentication.

Default value

No default value defined.

Valid Values

You can select one of the following values depending on Kafka server's authentication configurations.

- SASL_PLAINTEXT
- SASL_PLAINTEXT_SSL
- SSL

UserForKafkaDataSource

Description

Specifies the HCL Unica user that references the data source that contains the Kafka services access credentials. You configure this value when you create a system user.

Default value

No default value defined.

Valid Values

Any valid user that reference Kafka datasource

sasl.jaas.config.dataSource

Description

Kafka uses the Java Authentication and Authorization Service (JAAS) for SASL configuration. You must provide JAAS configurations for all SASL authentication mechanisms.

Default value

No default value defined.

Valid Values

Refer "listener.name.sasl_ssl.plain.sasl.jaas.config" as in kafka_home/server.properties

truststore.location

Description

Specifies the path of "kafka.server.truststore.jks"

Default value

No default value defined.

Valid Values

Path of "kafka.server.truststore.jks" file as mentioned in kafka_home/server.properties/ssl.truststore.location.

truststore.password.dataSource

Description

Specifies the Platform data source that contains the Kafka truststore login credentials. You configure this value when you create a system user.

Default value

No default value defined.

Valid Values

Path of "kafka.server.keystore.jks" as mentioned in kafka_home/server.properties/ ssl.keystore.location.

keystore.password.dataSource

Description

Specifies the Platform data source that contains the Kafka keystore login credentials. You configure this value when you create a system user.

Default value

No default value defined.

Valid Values

Datasource which contains the kafka keystore login credentials

key.password.dataSource

Description

Specifies the Platform data source that contains the Kafka key login credentials. You configure this value when you create a system user.

Default value

No default value defined.

Valid Values

Datasource which contains the kafka key login credentials

ssl.endpoint.identification.algorithm

Description

Specifies the endpoint identification algorithm used by clients to validate server host name. Disable server host name verification by setting ssl.endpoint.identification.algorithm to an empty string.

Default value

empty

Valid Values

Refer ssl.endpoint.identification.algorithm as mentioned in kafka_home/server.properties.

Note: On premise Confluent Kafka support - Journey works with on-premise Confluent Kafka with no security mechanism. Google Managed Confluent Kafka - journeys works with google managed confluent kafka with security mechanism as SASL_SSL with PLAIN mechanism and no SSL certificates.

Chapter 14. Kafka authentication using Kerberos

Clients (producers, consumers, connect workers, etc) will authenticate to the cluster with their own principal (usually with the same name as the user running the client), so obtain or create these principals as needed. Then configure the JAAS configuration property for each client. Different clients within a JVM may run as different users by specifying different principals.

Before starting Kafka kerberos configuration with Journey:

From Kerberos hosted machine copy all the files available at location /var/kerberos/krb5kdc to Journey installation location <Journey-HOME>/Journey/Web/properties

From Kerberos hosted machine copy **krb5.conf** file available at location /etc to Journey installation location -> <Journey-HOME>/Journey/Web/properties

Note: Host name of kafka_Hosted machine is added on Unica application hosted machine and vice versa and make sure that Kafka communication working good between two machines.

1. Enable the Kafka Security for Journey Engine and Journey WEB

 \circ For Journey Engine - Please replace the krb5 file location to the <code><JOURNEY_HOME>/Engine/</code>

journey_master_config.properties

kafka.security.enabled=Y

kafka.security.protocols.enabled=GSSAPI

• For Journey WEB - Please replace the krb5 file location to the <JOURNEY_HOME>/WEB/properties/ application.properties

kafka.security.enabled=Y

kafka.security.protocols.enabled=GSSAPI

- 2. Make sure the keytabs configured in the JAAS configuration are readable by the operating system user who is starting kafka client.
 - For Journey Engine Please replace the kafka_server_jaas.conf file location to the <JOURNEY_HOME>/Engine/ journey_master_config.properties

java.security.auth.login.config = <jass LOCATION> example - /etc/kafka_server_jaas.conf

• For Journey WEB - Please replace the kafka_server_jaas.conf file location to the <JOURNEY_HOME>/WEB/ properties/application.properties

java.security.auth.login.config = <jass LOCATION> example - /etc/kafka_server_jaas.conf

3. Pass the krb5 file locations as JVM parameters to each client JVM

• For Journey Engine - Please replace the krb5 file location to the <JOURNEY_HOME>/Engine/

journey_master_config.properties

java.security.krb5.conf = <krb5 LOCATION> example - /etc/krb5.conf

• For Journey WEB - Please replace the krb5 file location to the <JOURNEY_HOME>/WEB/properties/

application.properties

java.security.krb5.conf = <krb5 LOCATION> example - /etc/krb5.conf

While configuring Kerberos with Kafka add/update below changes in below file:

Location - /<Journey-HOME>/Journey/KafkaStandalone/config/server.properties

```
sal.enabled.mechanisms=GSSAPI
sasl.mechanism.inter.broker.protocol=GSSAPI
security.inter.broker.protocol=SASL_PLAINTEXT
listeners=SASL_PLAINTEXT://0.0.0.0:9092
advertised.listeners=SASL_PLAINTEXT://<Kafka_Kerberos_principle_host_name>:9092
#E.g.
advertised.listeners=SASL_PLAINTEXT://
ip-10-10-10-100.ap-south-1.compute.internal.nonprod.hclpnp.com:9092
listener.name.sasl_plaintext.gssapi.sasl.jaas.config=com.sun.security.auth.module.Krb5LoginModule
required useKeyTab=true storeKey=true
keyTab="/var/kerberos/krb5kdc/kfkserver.keytab" principal="kafka/<Kafka_Kerberos_principle_host_name>";
sasl.kerberos.service.name=kafka
#e.g. keyTab="/var/kerberos/krb5kdc/kfkserver.keytab"
principal="kafka/ip-10-10-10-100.ap-south-1.compute.internal.nonprod.hclpnp.com";
sasl.kerberos.service.name=kafka
```

Note: This value will change as per your kafka principle

ip-10-10-100.ap-south-1.compute.internal.nonprod.hclpnp.com@HCLPNP.COM

5. Add Kafka kerberos host name in Journey Engine and Journey WEB application.properties file

spring.kafka.bootstrap-servers=<Kafka_Kerbersos_Host_Name>:9092

- 6. Create folders by name -> krb5.conf.d and log at location /<Journey-HOME>/Journey/Web/properties
- 7. update file kafka_server_kerberos_jaas.conf OR equivalent Kafka Kerberos client conf available at location /

<Journey-HOME>/Journey/Web/properties with applicable kerberos details and recent paths as per Journey installation location

```
keyTab="/var/kerberos/krb5kdc/zkserver.keytab"
principal="zookeeper/ip-10-10-10-0.ec2.internal.nonprod.hclpnp.com";
keyTab="/var/kerberos/krb5kdc/kfkserver.keytab"
principal="kafka/ip-10-10-10-10.ec2.internal.nonprod.hclpnp.com"
```

8. update file krb5.conf available at location /<Journey-HOME>/Journey/Web/properties with applicable

kerberos details and recent paths as per Journey installation location:

includedir /<Journey-HOME>/Journey/Web/properties/krb5.conf.d/
 [logging]
 default = FILE:/<Journey-HOME>/Journey/Web/properties/log/krb5libs.log

```
kdc = FILE:/<Journey-HOME>/Journey/Web/properties/log/krb5kdc.log
admin_server = FILE:/<Journey-HOME>/Journey/Web/properties/log/kadmind.log
```

JBOSS Setting for Kerberos Kafka Authentication

The below changes has been done in Jboss standalone.xml file to before start the Journey web:

- 1. Go to <JBOSS_HOME>\standalone\configuration\
- 2. Open standalone.xml
 - a. **Confirm the servlet-container node** must have all the below values. If not please replace the node with below provided set of lines

provided set of lines

```
<servlet-container name="default" disable-caching-for-secured-pages="false">
<jsp-config/>
<websockets/>
</servlet-container>
```

b. kafka_server_kerberos_jaas.conf and krb5.conf file path configure in standalone.xml as mention below

```
<property name="java.security.auth.login.config"
value="<Journey-HOME>/Journey/Web/properties/kafka_server_kerberos_jaas.conf"/>
<property name="java.security.krb5.conf"
value="<Journey-HOME>/Journey/Web/properties/krb5.conf"/>
<property name="java.security.krb5.debug" value="true"/>
<property name="java.security.disable.secdomain.option" value="true"/>
</system-properties>
```

c. Add the KafkaClient and KafkaServer conf in standalone.xml as shown below

```
<security-domain name="KafkaClient" cache-type="default">
 <authentication>
 <login-module code="com.sun.security.auth.module.Krb5LoginModule" flag="required">
 <module-option name="storeKey" value="true"/>
 <module-option name="useKeyTab" value="true"/>
 <module-option name="refreshKrb5Config" value="true"/>
 <module-option name="principal" value="<CLIENT-PRINCIPLE>"/> example -
 "kafka/ip-10-10-10.ec2.nonprod.hclpnp.com"
 <module-option name="keyTab" value="<Journey-HOME>/Journey/Web/properties/kfkserver.keytab"/>
 <module-option name="doNotPrompt" value="true"/>
 </login-module>
 </authentication>
</security-domain>
<security-domain name="KafkaServer" cache-type="default">
 <authentication>
<login-module code="com.sun.security.auth.module.Krb5LoginModule" flag="required">
<module-option name="storeKey" value="true"/>
<module-option name="useKeyTab" value="true"/>
 <module-option name="refreshKrb5Config" value="true"/>
 <module-option name="principal" value="<Server-PRINCIPLE>"/> example -
 "zookeeper/ip-10-10-10.ec2.nonprod.hclpnp.com"
 <module-option name="keyTab" value="<Journey-HOME>/Journey/Web/properties/zkserver.keytab"/>
 <module-option name="doNotPrompt" value="true"/>
</login-module>
 </authentication>
</security-domain>
```

62

Note: The values of the above mentioned parameter keyTab and principle must be same which has been generated at the time of Kerberos Server setup.

3. After saving the above changes in Jboss <JBOSS_HOME>\standalone\configurationstandalone.xml, Journey Web can be started. After configuring Journey with Kafka Kerberos, on Journey while creating Rest Entry source if application gives error like below user needs to verify node configuration of Confirm the **servlet-container** node as below.

Errors: Unable to fetch rest Api Or Unable to fetch Kafka

 Confirm the servlet-container node must have all the below values. If not please replace the node with below provided set of lines at below location:

```
<JBOSS_HOME>\standalone\configuration\standalone.xml
<servlet-container name="default" disable-caching-for-secured-pages="false">
<jsp-config/>
<websockets/>
</servlet-container>
```

WAS Setting for Kerberos Kafka Authentication

There are 2 files which needs to set in the environment of WebSphere.

1. Set krb5 in System Env

For Krb5 Server > Server Type > Select the server > Java and Process Management > Process Definition > Java Virtual Machine > Generic JVM arguments append the below mentioned argument in the Argument List

-Djava.security.krb5.conf=<KRB File Location>\krb5.conf

2. jass entries

Go to <WebSphere Home>\AppServer\profiles\<Profile>\properties\wsjaas.conf

Append the following entries into the file

KafkaServer

{ com.ibm.security.auth.module.Krb5LoginModule required useKeytab="<Zookeper Key Tab Path>
\zkserver.keytab" storeKey=true principal= <Zookeper Principle> eg- "zookeeper/ip-10-10-10-10.apsouth-1.compute.internal.nonprod.hclpnp.com" credsType = both; }

KafkaClient

{ com.ibm.security.auth.module.Krb5LoginModule required useKeytab="<Kafka Server Kay
Tab Path>\kfkserver.keytab" principal= <Kafka Principle> eg - "kafka/ip-10-10-10-10.apsouth-1.compute.internal.nonprod.hclpnp.com" credsType = both debug=true; }

Restart Application Server.

Configuring Kafka Kerberose for Deliver Responses:

Login to Unica application and navigate to below location:

1. Location > Settings > configuration > HCL Unica > Journey > Kafka > Configurations

```
Set:

KafkaBrokerURL: <Priciple_Hostname>:9092

CommunicationMechanism: GSSAPI

sasl.mechanism: GSSAPI

sasl.jass.config.location:

<JOURNEY_HOME>/WEB/properties/application.properties/kafka_server_Kerberose_jaas.conf

java.security.krb5.conf.location: <JOURNEY_HOME>/WEB/properties/application.properties/krb5.conf
```

2. Location: Settings > configuration > HCL Unica > Deliver > Kafka > RCT

```
Set:
```

```
Set
KafkaBrokerURL: <Priciple_Hostname>:9092
CommunicationMechanism: SASL_PLAINTEXT
sasl.mechanism: GSSAPI
```

Kafka Configuration for Configuring External resources in Journey (AssetPicker and Journey configuration)

Login to Unica application and navigate to below location:

Location > Settings > configuration > HCL Unica > Journey > Integration > dataSource > <System_Configuration Template

Name> > Kafka Configurations

```
Bootstrap servers (comma separated list of hosts)
                                                          <Karberos_Kafka_Principle_Host:>7001
(e.g. ip-10-10-10-100.nonprod.hclpnp.com:7001){}
Security protocol
                             SASL_PLAINTEXT
SASL mechanism
                          KERBEROS
Kerberos - Configuration file path (e.g. /etc/krb5.conf, C:/Windows/krb5.ini)
<JOURNEY_HOME>/WEB/properties/application.properties/krb5.conf
                                        <JOURNEY_HOME>/WEB/properties/kfkserver.keytab
Kerberos - Keytab file path
Kerberos - Principal
                           kafka/<Karberos_Kafka_Principle_Host>@HCLPNP.COM
e.g. kafka/ip-10-10-10-100.nonprod.hclpnp.com@HCLPNP.COM
Kerberos - Service Name
                                    kafka
```

Chapter 15. Configure Web Application servers Tomcat for SSL

On every application server on which a Unica application is deployed, configure the web application server to use the certificates you have decided to employ.

See your web application server documentation for details on performing these procedures.

Ensuring cookie security

Some cookies may not be properly secured in the client browser. Not securing cookies leaves the application vulnerable to man-in-the-middle and session hijacking attacks. To fix this issue, take the following precautions.

- Enforce the use of SSL at all times to reduce the risk of cookies being intercepted on the wire.
- In the web application server, set the secure and httponly flags on all cookies.
 - The secure flag tells the browser to send the cookie only over an HTTPS connection. You must enable SSL on
 - all applications that communicate with each other if you set this flag.
 - The httponly flag prevents cookies from being accessed through a client side script.

Setting the flags for SSL in Tomcat

To set the secure and httponly flags in Tomcat, perform the following changes in the .xml server of Tomcat.

About this task

```
<Connector port="7003" protocol="org.apache.coyote.http11.Http11NioProtocol"
maxThreads="150" SSLEnabled="true" scheme="https" acceptCount="100" clientAuth="false"
disableUploadTimeout="true" enableLookups="false" secure="true" sslProtocol="TLS"
keystoreFile="/opt/v12.1/v12.1.0.1.1/Campaign/SSL_NEW/PlatformClientIdentity.jks" keystorePass="password" >
</Connector>
```

Configure Unica Journey with SSL

To configure Unica Journey to use SSL, you must set some configuration properties. Use the procedures in this section that are appropriate for your installation of Unica Journey and the communications that you want to secure using SSL.

About this task

When you access your Unica installation over a secure connection, and when you set navigation properties for applications as described in the following procedures, you must use https and the secure port number in the URL. The default SSL port is8443 for Tomcat.

Follow this procedure to configure Journey with SSL

- 1. Log in to Unica and click **Settings > Configuration**.
- 2. Set the value of the Affinium | Journey | navigation property to Unica Journey URL.

For example: https://host.domain:SSL_port/unica

where:

- \circ $_{\it host}$ is the name or IP address of the machine on which Unica Journey is installed
- \circ $_{\textit{domain}}$ is your company domain in which your Unica products are installed
- \circ $_{\it SSL_Port}$ is the SSL port in the application server on which Unica Journey is deployed

Note https in the URL.

Chapter 16. Mailchimp Configuration

Configuration of Mailchimp as external source with Journey.

About this task

Navigate to Unica Platform > Settings > Configuration

From Configuration categories page navigate to Journey > Integration > dataSources

For Adding Journey datasource

1. Click systemconfigurationTemplates Result

The systemConfigurationTemplates page appears.

- 2. Provide the below information:
 - New category name: <Journey>
 - systemIdentifier: Journey
 - userCredentials: Default user
 - defaultUserCredentials : asm_Admin
 - o dataSourceNameForCredentials : <JOURNEY_DS_1>
 - AdditionalParameters :
 - event-publisher-service.kafka.topics: CIFINTEGRATION
 - event-publisher-service.kafka.topics.CIFINTEGRATION.value.format: Json

Note: For more information on the fields, see Unica Content Integration 12.1.9 Installation and Configuration Guide.

- 3. Click Save.
- 4. Expand the Journey node and click httpGateway

Result

The Settings for 'httpGateway' page appears.

5. Provide below information:

baseUrl : http:<hostname>:<port>/journey

6. Click on Kafka configuration link and add below information

Bootstrap servers (comma separated list of hosts) : <Kafkahost>:<port>

e.g. <IP OR Hostname>:9092

For Adding Mailchimp datasource

1. Click systemconfigurationTemplates

Result

- The systemConfigurationTemplates page appears.
- 2. Provide the below information:
 - New category name: <Mailchimp>
 - systemIdentifier: Mailchimp
 - userCredentials: Default user
 - defaultUserCredentials : asm_admin
 - dataSourceNameForCredentials : <Mailchimp_DS>

Note: For more information on the fields, see Unica Content Integration 12.1.9 Installation and Configuration Guide.

- 3. Click Save.
- 4. Expand the Mailchimp node and Click httpGateway

Result

The Settings for 'httpGateway' page appears.

5. Provide below information

baseUrl : https://<MailchimpHostname>/<Version>/

User needs to add these datasources in Journey. User need to gather below information:

- a. Journey Data Source UserId and password. Navigate to **Journey application > Settings > Rest** either create a new Rest Integration or use existing rest integration. Copy clientid and Client Secret.
- b. Mailchimp data source userid and password. Login to Mailchimp application and Navigate to Profile > Extra > API keys. Get the api keys and User column name will be user

In mailchimp a/c add Webhook url as below:

https://<AssetpickerHostname>:<Port>/asset-viewer/api/AssetPicker/webhook/Mailchimp/events/webhook_listener

Navigate to Platform Settings > Users

Click on Required user e.g. asm_Admin

Click on Edit dataSources link and add below data sources

Mailchimp_DS - user: <user> and password <API key>

JOURNEY_DS_1 - user: <clientid> and password <Client Secret>

Navigate to Unica Platform > Settings > configuration > Unica Platform > Security > API management > Unica Content Integration

Click API configuration template and add below information

- New category name : <Mailchimp>
- API URI : /webhook/Mailchimp/events/*
- Require authentication for API access unselected

Click Save

After performing these steps Mailchimp will be added as external source in Journey.

Note:

- If the user configures an external source in Journey, keep the following properties as False. This will allow the user to get the data from external source as per significant field configured in Journey data deduplication settings.
 - <rule-enabled>false</rule-enabled>\<JourneyEngine>\conf\data-validation-rules.xml
 - In Platform, navigate to Settings > Configuration > Journey > Journey Configuration and set the value of the Validation_On_Journey_Records property to False.
- For configuring external source user must install Unica Content Integration component while installing or upgrading Unica Platform as a prerequisite.

Chapter 17. Settings

Use the settings menu to manage the Journey integrations like Email connectors, SMS connectors, CRM connections, and REST integrations.

Setting a default email connection

If you have multiple connectors to Unica Link for sending an email, you can set the default email connection in the **Settings** menu.

About this task

To set a default email connection, complete the following steps:

Result

The Email page appears.

2. From the Available Connections list, select a connection.

The available connection includes Mandril, Mailchimp, etc.

3. Click Save.

You can also deselect an existing connection and click Save. This ensures that no default connection is set.

Setting a default SMS connection

If you have multiple connectors to Unica Link for sending an SMS, you can set the default SMS connection in the **Settings** menu.

About this task

To set a default SMS connection, complete the following steps:

Result

The SMS page appears.

2. From the Available Connections list, select a connection.

Phone number formats should be mentioned as per the specification of the delivery channel. Journey will send the phone number in the same format to delivery channel. For example, in reference Twilio connection phone number format supported with Journey is as follows:

- <plus sign><country-code><10-digit phone number>-+15403241212.
- <plus sign> <country-code <(area-code)> <three-digit number><four-digit number>-+1 (540) 324
 1212.
- o <plus sign>-<country-code>-<area-code>-<three-digit number>-<four-digit number> -
 - +1-540-324-1212.
- <plus sign> <country-code>-<area-code>-<three-digit number>-<four-digit number>- +1 540-324-1212.

Whatever format of phone number you provide, Unica Journey will save the number in the following format: *cplus sign><country-code><10-digit phone number>*. For example, if you provide phone number as +1 540-324-1212, Unica Journey stores the phone number as +15403241212.

If you select Twilio as the default SMS connection, it will accept phone numbers only in the following format: *<plus* sign><country-code><10-digit phone number>. For example, +15403241212.

3. Click Save.

Setting a default CRM connection

If you have multiple CRM connections, you can set the default CRM connection in the Settings menu.

About this task

To set a default CRM connection, complete the following steps:

Result

The **CRM** page appears.

- 2. From the Available Connections list, select a connection.
- 3. Click Save.

Setting a default ADTECH connection

If you have multiple ADTECH connections, you can set the default ADTECH connection in the Settings menu.

About this task

1.

To set a default ADTECH connection, complete the following steps:

Result ADTECH page appears

- 2. From the Available Connections list, select a connection.
- 3. Click Save.

Setting a default Database connection

If you have multiple Database connections, you can set the default database connection in the Settings menu.

About this task

To set a default Database connection, complete the following steps:

1. Select > Link > Database

Result

Database page appears

- 2. From the Available Connections list, select a connection.
- 3. Click Save.

Setting a default PUSH connection

If you have multiple connectors to Unica Link for sending PUSH, you can set the default email connection in the Settings menu.

About this task

To set a default PUSH connection, complete the following steps:

Result

The Push page appears.

2. From the Available Connections list, select a connection.

The available connection includes Batch_Android and Batch_ios. For more information, see Manage connections on page 72.

3. Click Save.

You can also deselect an existing connection and click Save. This ensures that no default connection is set.

Manage connections

You can manage Unica Link connections from this menu.

About this task

You can create a connection with Unica Link connectors like Mailchimp, Mandrill, Salesforce, and Twilio. You can view all existing connections in the **Existing Connections** (*n*) panel, where *n* is the number of connections.

1. To create a Mailchimp connection, complete the following steps:

a. Select 🔯 > Link > Manage Connections > Create New. Result

The Create New Connection page appears.

- b. Provide values for the following fields:
 - Name Mandatory
 - Description Optional
- c. Click Next.
- d. From the Choose Connection panel, select Mailchimp.
- e. In the Connection Properties panel, provide values for the following mandatory fields:

Note: To know about the fields and the values to be put, see *Unica Link Mailchimp Connector User Guide*.

- Base URL
- User ID
- API Key
- Activity Fetch Frequency
- Activity Fetch Units
- f. Click **Test** to the test the connection. If the provided values are correct, you will see a success message. If the provided values are incorrect, you will see an error message.
- g. To save the connection, click Save.

Result

The new connection is successfully saved and it appears in the Existing Connections panel.

2. To create a Mandril connection, complete the following steps:

a. Select 🔯

Link > Manage Connections > Create New.

Result

The Create New Connection page appears.

- b. Provide values for the following fields:
 - Name Mandatory
 - Description Optional
- c. Click Next.
- d. From the Choose Connection panel, select Mandrill.
- e. In the Connection Properties panel, provide values for the following mandatory fields:

Note: To know about the fields and the values to be put, see Unica Link Mandrill User Guide.

- API Key
- Activity Fetch Frequency
- Activity Fetch Units
- f. Click **Test** to the test the connection. If the provided values are correct, you will see a success message. If the provided values are incorrect, you will see an error message.
- g. To save the connection, click Save.

Result

The new connection is successfully saved and it appears in the Existing Connections panel.

3. To create a Salesforce connection, complete the following steps:

a. Select 🔯

> Link > Manage Connections > Create New.

Result

The Create New Connection page appears.

- b. Provide values for the following fields:
 - Name Mandatory
 - Description Optional
- c. Click Next.
- d. From the Choose Connection panel, select Salesforce.
- e. In the Connection Properties panel, provide values for the following mandatory fields:

Note: To know about the fields and the values to be put, see Unica Link Salesforce User Guide.

- Instance URL
- Access Token
- Version
- f. Click **Test** to the test the connection. If the provided values are correct, you will see a success message. If the provided values are incorrect, you will see an error message.
- g. To save the connection, click **Save**.

Result

The new connection is successfully saved and it appears in the Existing Connections panel.

4. To create a Twilio connection, complete the following steps:

a. Select > Link > Manage Connections > Create New.

Result

The **Create New Connection** page appears.

- b. Provide values for the following fields:
 - Name Mandatory
 - Description Optional
- c. Click Next.
- d. From the Choose Connection panel, select Twilio.
- e. In the Connection Properties panel, provide values for the following mandatory fields:

Note: To know about the fields and the values to be put, see Unica Link Twilio User Guide.

- Base URL
- Account SID
- Auth Token
- From Number
- Retry Interval
- Retry Attempts
- f. Click **Test** to the test the connection. If the provided values are correct, you will see a success message. If the provided values are incorrect, you will see an error message.
- g. To save the connection, click Save.

Result

The new connection is successfully saved and it appears in the Existing Connections panel.

5. To create a Batch connection for Android or iOS, complete the following steps:

a. Select

Link > Manage Connections > Create New.

Result

The Create New Connection page appears.

- b. Provide values for the following fields:
 - Name Mandatory. For example, Batch_Android / Batch_iOS
 - Description Optional
- c. Click Next.
- d. From the Choose Connection panel, select Batch.

- e. In the Connection Properties panel, provide values for the following mandatory fields:
 - BAse URL
 - Live Key
 - Rest Key
 - Activity Fetch Frequency
 - Activity Fetch Units
- f. Click **Test** to the test the connection. If the provided values are correct, you will see a success message. If the provided values are incorrect, you will see an error message.
- g. To save the connection, click Save.

Result

The new connection is successfully saved and it appears in the Existing Connections panel.

Note: If you want Batch connection for both Android and iOS, you must create a Batch connection for each.

REST Integration

REST keys are used for third-party login to the application. You can generate key-value pair and using the key value pair, you can login to Journey using third-party applications.

Creating a new REST integration

To create a new REST integration key pair, complete the following steps:

1. Select REST.

Result

The **REST** page appears.

2. Click + REST Integration.

Result

The New REST Integration page appears.

- 3. Provide values for the following fields:
 - App Name Mandatory.
 - Description Optional.
- 4. Click Generate Keys.

Result

The system generates a ClientID and ClientSecret.

- 5. Use the toggle bar to change the Status to Active or Inactive. By default, the Status is Active.
- 6. To save the REST integration, click Save.

To send audience data to Journey, follow the details mentioned on the REST Entry Source used for configuring the REST end point. Use the **ClientID** and **ClientSecret**, which you received when executing Step (4), for configuring the REST end point on Entry Source.

7. Generate the authentication token using the URL example: "http://comp-4946-.nonprod.hclpnp.com:80/journey/api/ thirdpartylogin". Use this authentication token and entry source code while sending the data.

Note: Entry source code is mandatory to send data on REST entry source.

- 8. 8. REST API end point (as available on REST entry source creation page) example http:// comp-4946-1.nonprod.hclpnp.com:80/journey/api/entrysources/rest/data
- 9. Sample format of JSON that /journey/api/entrysources/rest/data takes as input is as below -

{

"entrySourceCode": "ES-00000125",

"data": [

{ "Email": "pooja_sharma@hcl.com", "FirstName": "Pooja", "LastName": "Sharma", "Age": 30, "Address": 125, "CreatedDate": "15 09 22", "PHONE_NUMBER": "+919623444160", "DeviceID":"ac79649c-ca1b-4c3f-99ce-56d5ad69fbba" }

]

}

Note: The json fields should be changed as per the data definition which is associated with the journey.

10. Journey should be in published state before pushing the data on REST entry source.

Viewing REST integration list

Unica Journey maintains a list of REST integrations created.

About this task

To view a list of REST integrations, complete the following steps:

Result

The **REST** page appears.

- 2. Perform any one of the following operations:
 - a. To view the list of REST integrations in ascending order or descending order on the Name field, click Name.
 - b. To view the list of REST integrations in ascending order or descending order on the Description field, click **Description**.

Modifying an existing REST integration

You can only modify the description and the status of an existing REST integration.

About this task

To modify an existing REST integration, complete the following steps:

Result

The **REST** page appears.

2. To modify a rest integration, you can either:

Choose from:

 $^{\circ}$ select the required REST integration from the list

• select

Result

The Update REST Integration page appears.

3. You can update only the following fields:

Choose from:

• Description

• Status

4. To save the modifications, click Save.

Deleting REST integrations

You can only delete inactive REST integrations that are no longer used or needed.

Before you begin

To change the status of a REST integration entry, see Modifying an existing REST integration on page 77.

About this task

To remove existing inactive REST integrations, complete the following steps:

Result

The **REST** page appears.

2. Perform either of the following steps:

Choose from:

- To delete a REST integration, select
- succeeding the REST integration in the list.
- To delete multiple REST integrations, select the checkboxes preceding the REST integrations, in the list, that you want to delete and click **Delete**.
- 3. A confirmation box appears. To proceed with the deletion, click $\ensuremath{\textbf{Ok}}$.

Use of custom key store and trust store

In case of configuring a rest touchpoint for secure Rest API i.e. the API with url that starts with [https://|https:], a need might arise to configure ssl key-certificates depending on the implementation of third party rest API.

Usually, ssl certificates can be configured in java installation folder or can be configured in entirely different folder. In later case, system administrator needs to make following settings in the application.properties of journey engine i.e. in the file <installation location of journey application>\Engine\application.properties

ssl.restclient.custom.store

true: If the trust store and keystore of journey application are present at some custom location (or folder) and the certificates of journey and 3rd party system are to be imported in that location instead of in the installation directory of java runtime.

false: If the certificates are to be imported in the installation directory of java runtime.

ssl.restclient.truststore.defaultalgorithm

The standard name of the requested trust management algorithm.

Refer https://docs.oracle.com/javase/8/docs/technotes/guides/security/jsse/JSSERefGuide.html to get more information on the standard algorithm names.

Specimen value SunX509

ssl.restclient.keystore.defaultalgorithm

The standard name of the requested algorithm. Refer https://docs.oracle.com/javase/8/docs/technotes/guides/ security/jsse/JSSERefGuide.html to get more information on the standard algorithm names.

Specimen value SunX509

ssl.restclient.truststore.type

Represents the type of trust store (defaults to JKS)

A trust store is a repository or storage location for digital certificates, specifically public key certificates, that are used to establish trust in secure communications.

Trust stores store public key certificates of trusted entities, such as certificate authorities (CAs) and trusted servers.

They are used to verify the authenticity of remote entities (such as websites or servers) during the SSL/TLS handshake process.

ssl.restclient.truststore.location

A folder or a directory on the file system which represents the truststore of journey application.

ssl.restclient.truststore.password

Usually, the truststores are password protected. This parameter represents the trust store password.

ssl.restclient.keystore.type

Represents the type of keystore (defaults to JKS)

A keystore represents a storage facility for cryptographickeys and certificates. Keystores often store private keys, which are essential for encrypting and decrypting data, creating digital signatures, and establishing secure communications.

ssl.restclient.keystore.location

A folder or a directory on the file system which represents the keystore of journey application.

ssl.restclient.keystore.password

Usually, the keystores are password protected. This parameter represents the key store password.

ssl.restclient.key.password

Usually, the keys inside a keystore are also password protected. This parameter represents the key password.

ssl.restclient.protocols

comma separated list of supported cryptographic protocols which are designed to provide secure communication over a network

Recommended values TLSv1.2

ssl.restclient.truststore.password.encrypted

When set to true or missing, specify the encrypted value of the password in ssl.restclient.truststore.password

When set to false, specify plain text value of the password in ssl.restclient.truststore.password

Note: If the password is going to be blank, then set this flag to false.

ssl.restclient.keystore.password.encrypted

When set to true or missing, specify the encrypted value of the password in ssl.restclient.keystore.password

When set to false, specify plain text value of the password in ssl.restclient.keystore.password

Note: If the password is going to be blank, then set this flag to false.

ssl.restclient.key.password.encrypted

When set to true or missing, specify the encrypted value of the password in ssl.restclient.key.password

When set to false, specify plain text value of the password in ssl.restclient.key.password

Note: If the password is going to be blank, then set this flag to false.

To encrypt the password, Please execute following utility which is present in the <Journey install location>/tools folder JourneyEncryptionUtility.bat(or .sh)

Usage : JourneyEncryptionUtility.bat(or .sh) <plaintext password>

Example

If the plain text password is 'abcd', then JourneyEncryptionUtility.bat(or.sh) abcd

It will output something similar to the one given below

Entered String is : abcd

Encrypted String is : MIuFcm7mkspvIMEx7XywAA==

Set the encrypted value MluFcm7mkspvIMEx7XywAA== in the application.properties for the parameter in question. If you are using different password values for all the above-mentioned three parameters, then run this utility thrice and use the values accordingly.

Journey Proxy Integration

Proxy server has been integrated into journey web and Engine Projects, this gives user an upper hand in adding security and keeping application server behind proxy servers. Proxy server will interact with Deliver, Link and Platform servers.

Journey Web – Communicates with Deliver, Link and Platform server for fetching configuration details and while integrating Email/SMS/AdTech Point in Journey.

Journey Engine – Uses proxy to communicate with Deliver/Link Server for submitted Email/SMS/Adtech details to end servers.

Proxy Supported by Journey Web

1. SOCKS

2. HTTP

3. HTTPS

Proxy Supported by Journey Engine

1. HTTP

Note: SOCKS and HTTPS proxy is not supported by SOAP (Apache Axis2) used by Engine to communicate with Deliver.

Property to be configured for Engine in Engine application.properties file

- journey.proxy.type=NONE
- spring.proxy.host=[IP]
- spring.proxy.port=[PORT]
- spring.proxy.username=[username]
- spring.proxy.password=[password]

Property to be configured for Web in Web application.properties file

- journey.proxy.type=NONE
- spring.proxy.host=[IP]
- spring.proxy.port=[PORT]
- spring.proxy.username=[USERNAME]
- spring.proxy.password=[PASSWORD]
- server.use-forward-headers=true

Note: Default value of property journey.proxy.type is NONE, when set to NONE proxy is disabled.

Journey Engine Connection Pool settings

- journey.datasource.maxpool.size=[MAX_POOL_SIZE] set size of Db cnnection Pool
- journey.datasource.minIdle.size=[MIN_IDLE_SIZE] sets size of minimum idle connections

Developer Tools

Displays the list of developer tools.

API Documentation

User can find the list of REST APIs for Journey.
